ANNUAL SUMMARY FOR 1998

Although much of Oklahoma suffered through an intense drought in 1998, plentiful moisture during the other seasons and in other parts of the state actually provided the state with above normal precipitation. The statewide-averaged precipitation for the year, 36.57 inches, was 2.33 inches greater than normal, ranking 1998 as Oklahoma's 32nd wettest year since 1892. The west central, southwestern, and south central climate divisions, each suffering record-breaking droughts that extended from April through September, finished the year with less than normal precipitation.

Statewide-Averaged Precipitation in inches by Season (Rank: 1=driest, 107=wettest)

Season	Precip.	Dep.	Rank
Winter (Dec 97-Feb 98)	8.96	+4.26	106
Spring (Mar-May 98)	10.68	-0.08	61
Summer (Jun-Aug 98)	5.77	-3.62	5
Autumn (Sep-Nov 98)	13.23	+3.80	99

The drought began in early April, serendipitously providing excellent ripening and harvest weather for a bumper wheat crop. Southeastern portions of the state were affected first. The dry weather then spread across the southern two-thirds of the state. Over 300 wildfires, most manmade, some intentionally, destroyed as much as 14,000 acres of woodland during July. Spring planted crops were stunted by the lack of moisture. State cotton producers reported their smallest harvest since record keeping began in 1895. Agricultural losses were estimated at \$2 billion. Topical Storm Frances brought drought-breaking rains to eastern Oklahoma in mid-September. The state entered a period of widespread rain during a stormy October, effectively ending the drought, although some areas in southwestern and south central Oklahoma still had not recovered completely by year's end.

Climate Division-averaged Precipitation in inches (Rank: 1=driest, 104=wettest)

	Apr-Sep	Dep.	Rank (Record-year)	Ann.	Dep.
Panhandle	12.02	-3.11	25 (1910)	24.41	+4.08
North Central	16.83	-2.87	29 (1956)	40.10	+11.04
Northeast	21.46	-2.79	29 (1901)	46.11	+5.96
West Central	7.58	-10.99	1 (1984)	25.38	-1.76
Central	13.87	-8.05	6 (1956)	36.76	+2.08
East Central	18.81	-5.57	14 (1936)	47.52	+4.43
Southwest	6.31	-12.34	1 (1984)	23.07	-5.10
South Central	10.20	-12.25	1 (1956)	34.21	-3.34
Southeast	18.91	-6.45	13 (1896)	50.29	+1.57

Flooding occurred along several streams in March, notably: Poteau, Cimarron, North Fork of the Red, Deep Fork, and Washita rivers and Bird Creek. Erosion by floodwaters along the Cimarron caused the bank to collapse from under homes in the Twin Lakes

community south of Crescent. Further flooding was reported in the northeastern quarter of the state in October and early November in response to frequent and widespread heavy rain.

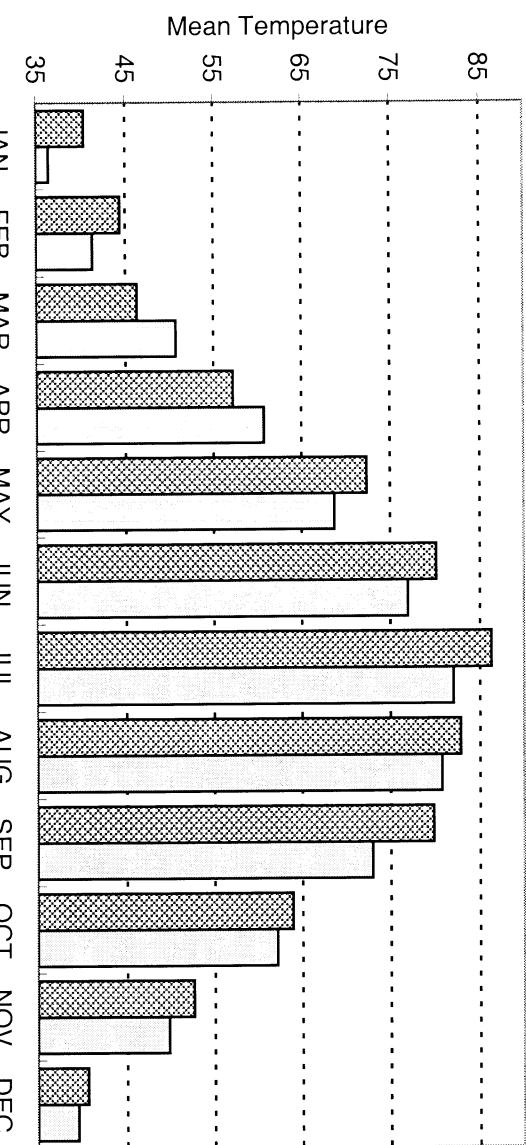

Average monthly temperatures were greater than normal, statewide, in every month except March and April. The statewide-averaged temperature, 62.3 degrees, was 2.0 degrees greater than normal, making 1998 the 10th warmest year since 1892. Summer temperatures averaged 83.2 degrees across the state, 3.2 degrees greater than normal. During autumn, temperatures averaged 65.4 degrees, exceeding the seasonal normal by 3.8 degrees. These were the 4th warmest autumn and the 8th warmest summer in the 107 years on record. The statewide-averaged temperature in July was the 4th highest for that month on record. The state experienced its 2nd warmest September since 1892. Twenty-four people died from heat-related causes in Oklahoma from July through September.

Oklahoma was battered by 83 tornadoes in 1998, the 5th greatest number in a single year since 1950. A total of 27 tornadoes were reported, statewide, in October, obliterating the previous state record for the month of 8 set in 1970. Twenty-six of those tornadoes occurred on the 4th to establish a national record for "most tornadoes in one state on one day in October." Other active months were May and June, each with 22 tornadoes. There were 35 injuries and no deaths associated with tornadoes in 1998. Twenty-two people were injured on June 13 when 9 tornadoes struck in central Oklahoma. Twenty-one people were injured were in the northern Oklahoma City when one tornado struck moved through Nichols Hills and vicinity and another one narrowly missed a crowded amusement park. Eleven injuries were associated with October 4 tornadoes, including six in Lincoln County near Prague and four near Haydenville in Okfuskee County. Two tornadoes, May 24 near Lamont in Grant County and October 4 in Seminole and Pottawatomie south of Prague, reached F3 (severe tornado) on the Fujita rating scale.

Oklahoma Tornadoes by Month 1998

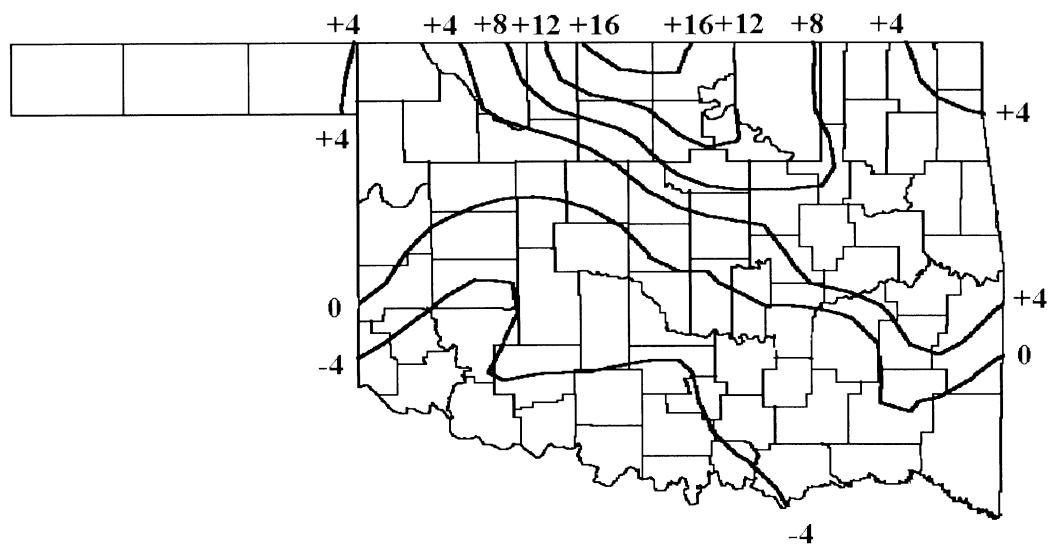

Number of Tornadoes in Oklahoma Total each Year, 1950-1998

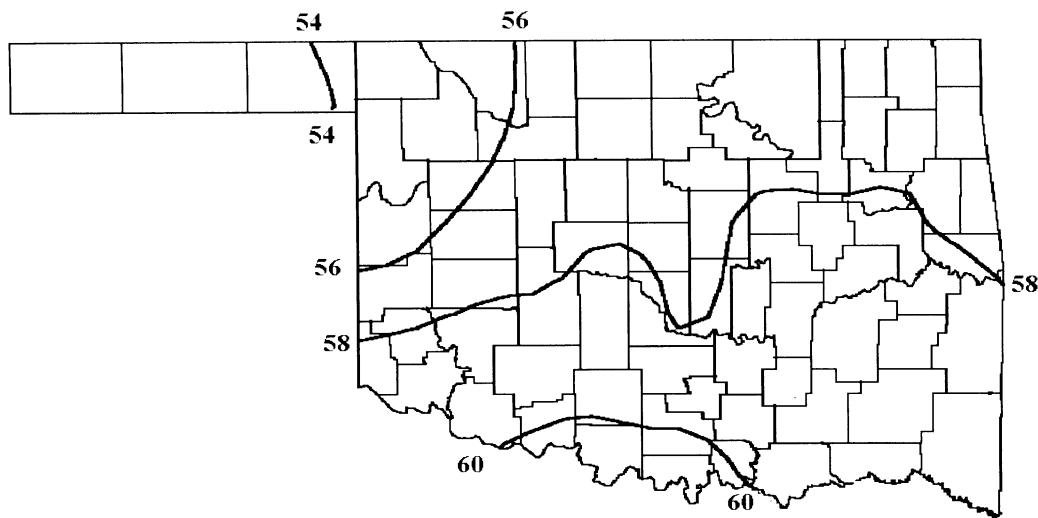

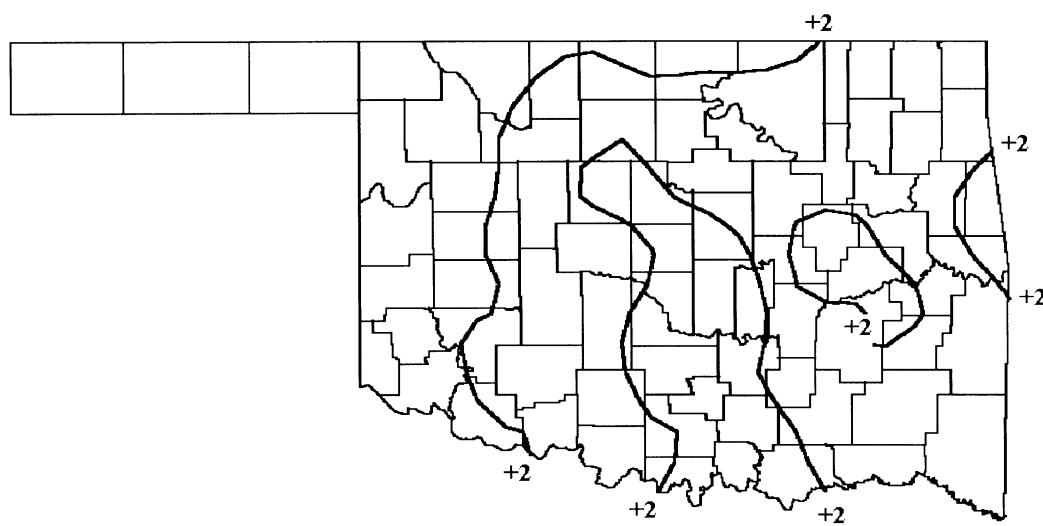

1998 TOTAL PRECIPITATION (inches)

1998 DEPARTURE FROM NORMAL PRECIPITATION (inches)

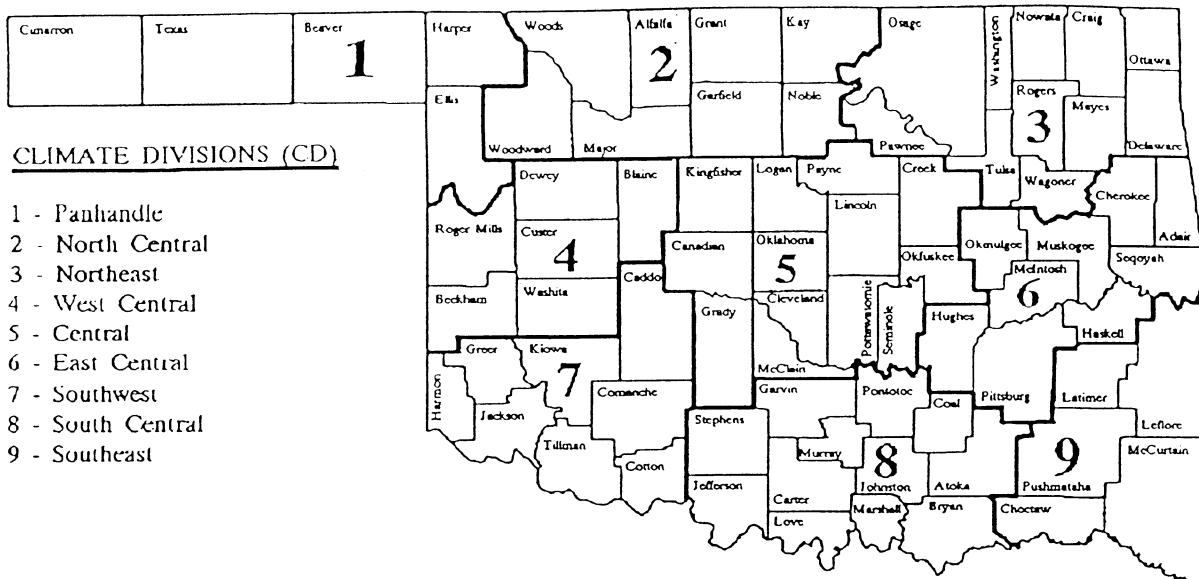

1998 ANNUAL AVERAGE DAILY TEMPERATURE (F)

1998 DEPARTURE FROM NORMAL TEMPERATURE (F)

OKLAHOMA

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

Station Name:

Station Identification Number: These are usually assigned by the National Climatic Data Center.

Climate Division: See the figure above.

Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and the average temperature for the day is less than 65 degrees. Daily values are summed to arrive at a monthly total. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

$$\sum_{i=1}^{29} 65 - ((TMAX_i + TMIN_i) / 2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and the average temperature for the day exceeds 65 degrees. Daily values are summed to give a monthly total. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i) / 2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.
