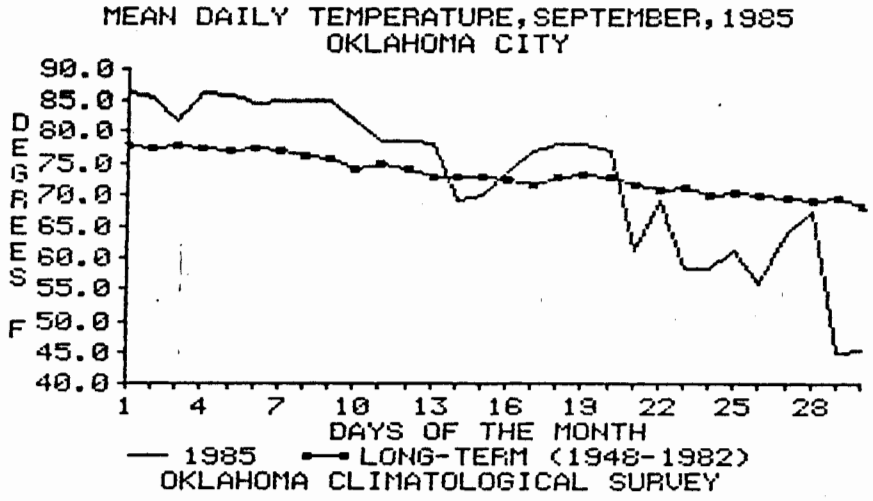
The Oklahoma Climatological Survey was established with its own budget and offices in the spring of 1980. The mission of the Survey is to provide a climatological archiving and information service to the State of Oklahoma. Although as many as 160 stations may appear in any one Summary, it may not be possible to list every station report received at the Survey as we plan to have the summaries in the mail before the middle of each month. If you would like information about a station that does appear, please feel free to contact the Climate Survey. If you would like to know more about the services we offer or our plans for the future, please let us hear from you. You can help us by contributing to our newspaper clipping file. If you see an article in your local newspaper dealing with some impact of climate on your community, please clip it and send it to us along with the name of the newspaper and the date the article appeared.

OKLAHOMA CLIMATE SUMMARY SEPTEMBER 1985

September 1985 illustrates how rapidly the seasons can change in Oklahoma. Early September continued the series of extremely hot days, which began the end of August. This warm period extended through early September with no significant precipitation reports. But by month's end, most of the State was experiencing abnormally cool temperatures and locally heavy rainfall. National Climatic Data Center figures place the likelihood of temperatures at or below 32 degrees in the Panhandle and north central portions of the State prior to October at less than 1 in 10. That is, we would expect these or cooler temperatures this early in the Fall fewer than 10 times in 100 years. Historical temperature records also indicate these temperatures arrived 3 to 4 weeks earlier than normally expected (mid- to late-October). The lowest temperature in the State, 27 degrees, was reported on September 30 at Guymon. The result of this wide variation in temperatures throughout September is nearly normal mean monthly temperatures but above normal total energy cost, reflected by total degree days (heating plus cooling). The pattern of mean daily temperatures at Oklahoma City during September 1985 and their relationship to long term average conditions is provided in the figure below and is "typical" for the State.



Two daily temperature records were tied in Oklahoma City (1924 to present), two new records were set and one new 24-hour precipitation record was set (see table below).

Oklahoma City Daily Data Reports
for September, 1985

Date	Record	Previous Record	Year	New Record
23	24-hour precipitation	.54"	1968	.71"
24	lowest daily min temp	48	1942	46
*29	lowest daily max temp	47	1945	
30	highest daily max temp	57	1945	54
*30	highest daily min temp	37	1972	

* Tied record.

September precipitation was above normal in all but east central, south central and southeastern portions of the State. New total monthly precipitation records for September were set at Goodwell, Fargo, Woodward and Reydon. Drought indices indicate improved moisture conditions in southeastern Oklahoma. Protracted drought conditions are not anticipated for any other portions of the State (information provided by Climate Analysis Center, NOAA).

Sunday, September 8, thunderstorms containing from 60 to 85 mph winds were reported near Clinton. Two funnels were sited during the storm but storm damage was attributed to high winds. The Clinton Municipal Airport manager reported recording a wind speed of 88 mph at 7:20 pm. A second day of thunderstorms was reported on Monday, September 9. High winds, hail and heavy rain moved through east central Oklahoma. Wind gusts up to 70 mph were reported in Henryetta between 5 and 6 pm. Locally high winds and heavy rains continued through Tuesday, September 10 when a thunderstorm containing 50 mph winds and heavy rain moved through the area of Davis Air Field at Muskogee, in northeastern Oklahoma.

Rains soaked much of Oklahoma on Friday, September 13. The 24-hour maximum precipitation event was reported at Chelsea in northeastern Oklahoma where 4.92 inches of rain were reported. Reports of high winds accompained most precipitation observations. Wind gusts up to 63 mph were reported on the east side of Altus in southwestern Oklahoma.

Violent weather again moved into the State the evening of September 22. Severe thunderstorm warnings were issued for Cotton and Comache Counties as a storm system pushed northward from north Texas into southwestern Oklahoma. The town of Geronimo reported tennis ball-size hail and 60 mph winds in association with the heavy thunderstorms. 54 mph winds were reported at Lawton. Norman reported lightning, 40 mph winds and golfball to baseball-size hail. Two tornadoes were spotted south of the northwestern Oklahoma town of Cherokee which resulted in some locally heavy damage.

The month ended on a chilly note when temperatures dropped into the 30's. The Panhandle reported snow mixed with freezing rain on the 29th. The cold front which preceded these cool temperatures also brought hours of steady rain to most sections of the State. Southwestern Oklahoma reported brief torrential downpours and pea-size hail.

TABLE OF 1984/1985 SEPTMBER COMPARISONS

Station	September Temperatures (F) 1984	1985	September Precipitation (in.) 1984	1985
Goodwell	67.2	67.6	1.345	7.273
Lahoma	71.2	72.8	.461	3.64Ø
Mutual	7Ø.6	69.9	.5ØØ	4.48Ø

An Analysis of Operational Weather Modification Activities in Oklahoma

The Oklahoma Climatological Survey recently completed a study assessing the effectiveness of a group of weather modification projects in southwestern Oklahoma. The study pertained to operations conducted in Cotton County during the 1976 to 1978 growing seasons and in Cotton, Tillman, Kiowa, and Comanche Counties at various times in 1981 and 1982. Clouds were seeded with silver iodide crystals released from ground level in an effort to increase rainfall. All activities were conducted by a private contractor paid with funds raised by local sponsoring groups. The contractor was licensed by the Oklahoma Water Resources Board which also provided permits for the project as required under state law. No operations were conducted in the area during 1979 and 1980.

The results of the study, while not conclusive, did indicate that the average rainfall over and downwind of the targeted counties was approximately 10% greater than in the surrounding unseeded area on days when rain fell in both areas. The increased rainfall in the target area appears to have occurred on days with light to moderate rainfall. Further study indicated that the rainfall advantage observed did not appear during periods when no seeding operations were active. The apparent rain increase cannot definitely be ascribed to cloud seeding in the absence of confirming physical or statistical evidence.

A study by the Illinois State Water Survey of a similar activity in northwestern Oklahoma (1976-1982) failed to uncover any evidence of increased rainfall in the targeted areas. Some evidence of an increase in rainfall downwind of that target area was obtained.

The evaluation of the cloud seeding projects in southwestern Oklahoma was commissioned by the Oklahoma Water Resources Board. Copies of the report by OCS to the OWRB, "An Evaluation of Operational Weather Projects in Oklahoma", by Howard L. Johnson, Clement J. Todd and Robert Sladewski, may be obtained from OCS.

NEW PUBLICATION

The first in a series of Oklahoma Climatological Summaries, CLIMOCS, is being released this month by OCS. CLIMOCS is a summary of all Oklahoma stations having any data between 1954 and 1983 and is designed to update and complement the 1985 NOAA/NESDIS/NCDC publication "Climatography of the United States, No. 20 (1951 - 1980)." CLIMOCS contains climatological summary tables of monthly mean and extremes for nearly 300 cooperative stations (see example which follows). CLIMOCS is available for the entire State of Oklahoma at a cost of $10.00 per copy or .10 cents per station requested plus postage. Similar information is available for other states. Please contact OCS for price information. Price will vary with the number of stations available in each state.

In addition to the tables provided in CLIMOCS, monthly and annual summaries for the 30-year period for each cooperative station are available. These summaries contain means and totals for each month and year for temperature (if observed), precipitation and snowfall. Please contact the Survey for cost estimates.

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above provides the general station distribution and the locations of the climate divisions. Each station table contains the following:

station name:

station identification number: These are usually assigned by the National Climatic Data Center.

climate division: See the figure above.

mean monthly temperature:

number of temperature observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

deviation from normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

maximum daily maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

minimum daily minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

heating degree days: HDD are calculated each day of the month for which there is a temperature report and summed. They are a qualitative measure of how much heat was required to maintain an indoor temperature of 65 degrees. Missing observations may result in a artificially high or low value. For February 1984 HDD would be calculated as:

$$\sum_{i=1}^{29} (65 - (TMAX_i + TMIN_i)/2)$$

deviation from normal heating degree days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

cooling degree days: CDD are calculated each day of the month for which there is a temperature report and summed. They are a proxy measure of how much cooling was required to maintain an indoor temperature of 65 degree. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i)/2 - 65)$$

deviation from normal cooling degree days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

total precipitation: Often incorrectly referred to as mean precipitation this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

number of precipitation observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

deviation from normal precipitation: A positive value indicates more rain than normal was recieved. A negative valued indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

maximum 24-hour report and day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

EXPLANATION OF MAPS

To give a statewide perspective, a series of maps is produced each month from the information contained in the station tables. Each map is calculated using between 50 and 200 observations. Only station with complete monthly records are used. Each observation is put into one of three categories and assigned a plus (+), minus(-), or a dot (.). The minus is the lowest numeric catory, the dot is the middle and the plus the highest numeric category. If a map location has no report, a value is estimated. Each map is accompanied by its own legend. The categories will vary from month to month throughout the year. The categories for the deviations from normal maps will always remain constant. This is to facilitate comparisons between months and across years.

CLIMATE CALENDAR

The data on this calendar are for Oklahoma City. Normal values are calculated for the period 1950-1979. Extremes are found for the period of record (1924-present).
