

The Oklahoma Climatological Survey was established with its own budget and offices in the spring of 1980. The mission of the Survey is to provide a climatological archiving and information service to the State of Oklahoma. Although as many as 160 stations may appear in any one summary, it may not be possible to list every station report received at the Survey as we plan to have the summaries in the mail before the middle of each month. If you would like information about a station that does appear, please feel free to contact the Climate Survey. If you would like to know more about the services we offer or our plans for the future, please let us hear from you. You can help us by contributing to our newspaper clipping file. If you see an article in your local newspaper dealing with some impact of climate on your community, please clip it and send it to us along with the name of the newspaper and the date the article appeared.

OKLAHOMA CLIMATE SUMMARY JUNE 1987

June continued the rainy trend which began in May, with new storms compounding flood damage from previous rainfall events. Although well above average, June 1987 precipitation totals did not set any new records. Typically warm June temperatures were accompanied by high relative humidities. The conditions combined so that by mid-month the State was experiencing heat-stress conditions one to two weeks earlier than during 1986 (see 1987 Spring/Summer Climatological Conditions in Oklahoma, this issue).

Rainfall during May brought Lake Texoma to its highest level since 1957, 635.1 feet. Lake officials speculate that it could be months before the lake returns to its normal level of 617 feet. These and other problems were compounded when heavy rains began to fall during the first few days of June. In some portions of the State, damage resulting from early summer storms is estimated to exceed damage caused by the October 1986 flood (\$11 million in October 1986 and \$14 million for May 1987). The Waurika News-Democrat reported that Jefferson County farmers alone may be facing \$1 million in damages due to loss of crop quality and quantity, flattened fences and broken equipment caused by the floods.

The wheat harvest was able to begin in sandy well-drained areas. The first wheat was brought to an Oklahoma elevator May 27. More rain on Tuesday and Wednesday, June 9 and 10, halted combining activities across much of the State. Additional showers fell on June 17. Severe thunderstorms moved through portions of the State on Wednesday afternoon and evening producing large hail and very strong winds. Gusts up to 70 mph were recorded in the Lawton area. The storms moved into the State from several directions, with one line entering

southeastern Oklahoma from the east and another coming into western Oklahoma from the Texas Panhandle. The National Weather Service said winds gusted up to 70 mph at Gage shortly after 7 p.m. and hail up to an inch in diameter was reported in several parts of southeastern, north central and western Oklahoma.

A more widespread weather system developed in Colorado on Thursday, June 18, and moved slowly eastward across the State on the 19th. These storms produced heavy rains and severe weather through June 22. Meteorologist Gary Szatkowski was quoted as describing the severe weather as "a relapse into what we normally expect during April and May. Although severe weather is not rare during June, it usually occurs early in the month and then a drier summertime pattern establishes itself. Oklahoma's April and May were quieter than usual with no tornadoes at all during April." The system took several days to move out of the State. A map of precipitation totals for the reporting period June 20 - June 22 is provided in Figure 1.

June ended on yet another rainy note when heavy precipitation was reported on the 29th of June. The distribution of this late-month rainfall, reported as precipitation ending at 7 a.m. on June 30, is presented in Figure 2.

By month's end, most of Oklahoma had received above normal precipitation (accumulated since March 1). The exceptions were eastern and southwestern Oklahoma. Topsoil moisture supplies were adequate in 70% of State. Subsoil moisture conditions were adequate at all locations.

Figure 1: June 20-22, 1987 precipitation totals.

Figure 2: June 30, 1987 precipitation.

TABLE OF 1986/1987 COMPARISONS

Station	June Temperatures (F)		June Precipitation (in.)	
	1986	1987	1986	1987
Arnett	75.6	75.0	3.495	6.460
Enid	78.5	78.7	7.090	4.220
Mutual	76.3	75.8	4.970	3.041
Tulsa	79.7	79.3	4.272	3.120
Elk City	76.6	75.3	4.375	2.513
Oklahoma City	78.9	77.6	3.112	6.642
McAlester	78.5	77.6	3.154	4.802
Altus Irr. Sta.	78.3	78.6	3.760	5.490
Durant	79.0	77.4	11.432	7.720
Ada	78.1	77.2	4.410	2.210
Antlers	79.0	76.7	4.080	3.700

EXTREMES

1987 Spring/Summer Climatological Conditions in Oklahoma

By: Ellen Cooter

Oklahoma's moisture conditions going into the dry summer months are much better in 1987 than during 1986, but stressful temperature conditions this year have come one to two weeks earlier than last year. In 1986 heat stress conditions peaked between July 21 and August 1. This is a normal pattern and similar conditions may well prevail about the same time period in 1987. National Weather Service 30 and 90 day outlooks covering the calendar periods June 15 to July 15 and June 1 through August 31 call for near normal temperatures with the exception of the eastern 1/3 of the State. This area is projected to experience slightly above normal temperatures through the summer months.

During 1986, total precipitation received did not reach normal levels until May and then balanced at or slightly below normal conditions until September. July 1986 was particularly dry with some relief received during August. In 1987 we enter the summer after an extremely wet first quarter. April was alarmingly dry, but a wetter than normal May and June have helped to make up this deficit. With the possible exception of southeastern Oklahoma, surface water supplies should be adequate entering the normal summer drought period. National Weather Service 30 and 90 day outlooks call for near-normal precipitation to occur across the entire State. This means July and August monthly total precipitation should range from 4.16 inches in southwestern Oklahoma to 6.52 inches in the northeastern portion of the State.

CLIMATE DIVISIONS (CD)

- 1 - Panhandle
- 2 - North Central
- 3 - Northeast
- 4 - West Central
- 5 - Central
- 6 - East Central
- 7 - Southwest
- 8 - South Central
- 9 - Southeast

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

Station Name:

Station Identification Number: These are usually assigned by the National Climatic Data Center.

Climate Division: See the figure above.

Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and summed. They are a qualitative measure of how much heat was required to maintain an indoor temperature of 65 degrees. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

$$\sum_{i=1}^{29} ((65 - TMAX_i + TMIN_i)/2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and summed. They are a proxy measure of how much cooling was required to maintain an indoor temperature of 65 degrees. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i)/2 - 65)$$

Deviation from normal cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

EXPLANATION OF MAPS

To give a Statewide perspective, a series of maps is produced each month from the information contained in the station tables. Each map is calculated using between 50 and 200 observations. Only stations with complete monthly records are used. Each observation is put into one of three categories and assigned a plus (+), minus (-), or a dot (.). The minus is the lowest numeric category, the dot is the middle and the plus the highest numeric category. If a map location has no report, a value is estimated. Each map is accompanied by its own legend. The categories will vary from month to month throughout the year. The categories for the deviations from normal maps will always remain constant. This is to facilitate comparisons between months and across years.
