

The Oklahoma Climatological Survey was established with its own budget and offices in the spring of 1980. The mission of the Survey is to provide a climatological archiving and information service to the State of Oklahoma. Although as many as 160 stations may appear in any one summary, it may not be possible to list every station report received at the Survey as we plan to have the summaries in the mail before the middle of each month. If you would like information about a station that does appear, please feel free to contact the Climate Survey. If you would like to know more about the services we offer or our plans for the future, please let us hear from you. You can help us by contributing to our newspaper clipping file. If you see an article in your local newspaper dealing with some impact of climate on your community, please clip it and send it to us along with the name of the newspaper and the date the article appeared.

OKLAHOMA CLIMATE SUMMARY FEBRUARY 1988

February weather produced 24-hour temperature swings of 40 degrees, treacherously icy road conditions, and numerous damaging grass fires. All CD's recorded below normal temperatures. Oklahoma also experienced below normal precipitation. The eastern one-third of the State averaged less than .25".

Very cold temperatures at the beginning of February contrasted sharply with the balmy end of January. On the 2nd of February, below-freezing Arctic air entered the State behind a cold front, which lowered maximum temperatures Statewide by about 30 degrees from those of the previous day. Some central Oklahoma stations, including Bristow and Holdenville, recorded 40 degree temperature changes. The National Weather Service issued a freezing rain advisory for all but southeastern Oklahoma. Icy roads resulted in numerous accidents and 2 traffic fatalities.

Below freezing temperatures were common in all but the extreme southeast during the first week of February. Daily high temperatures averaged nearly 11 degrees cooler than normal. By the 7th, winds had become southerly, initiating a 10-20 degree warming over the next three days. Another mass of Arctic air plunged through the State on the 10th. Most stations recorded their lowest temperatures of the month on the 11th or 12th. Wind chills of -20 degrees were common Statewide. Sub-zero temperatures prevailed over the northern one-third of the State on the morning of the 11th. By the 12th all CD's had recorded single digit readings. Snow fell as far south as Lawton, Altus, and McAlester.

The wettest weather event of this abnormally dry February occurred on the 18th and 19th. A strengthening low pressure system moved toward the State producing rain over the eastern two-thirds of Oklahoma. Rainfall amounts on the 19th included Miami .89", Stroud and Okmulgee 1.13", Daisy 1.52", Tishomingo .69", and Hugo 1.51".

As that storm system left the State, the jet stream and its accompanying storm track shifted northward, leaving Oklahoma with several days of dry weather. Strong southerly winds quickly dried the dead or dormant grass. The National Weather Service issued a fire danger alert in response to these dangerous conditions. The alert preceded several days of grass fires. According to the Oklahoma City Fire Department, 22 grass fires were reported in a 15-hour period on the 22nd. Firefighters battled a 4000 acre grass fire for seven hours near the Greer-Beckham County line, combatting flames fanned by 30 mph winds. A grass fire in the Jones area destroyed 20 acres of grassland, several outbuildings and a house.

Warmer temperatures toward the end of the month increased the fire threat. Temperatures in the 70's were recorded Statewide as most stations experienced their highest temperature of the month between the 26th and 29th.

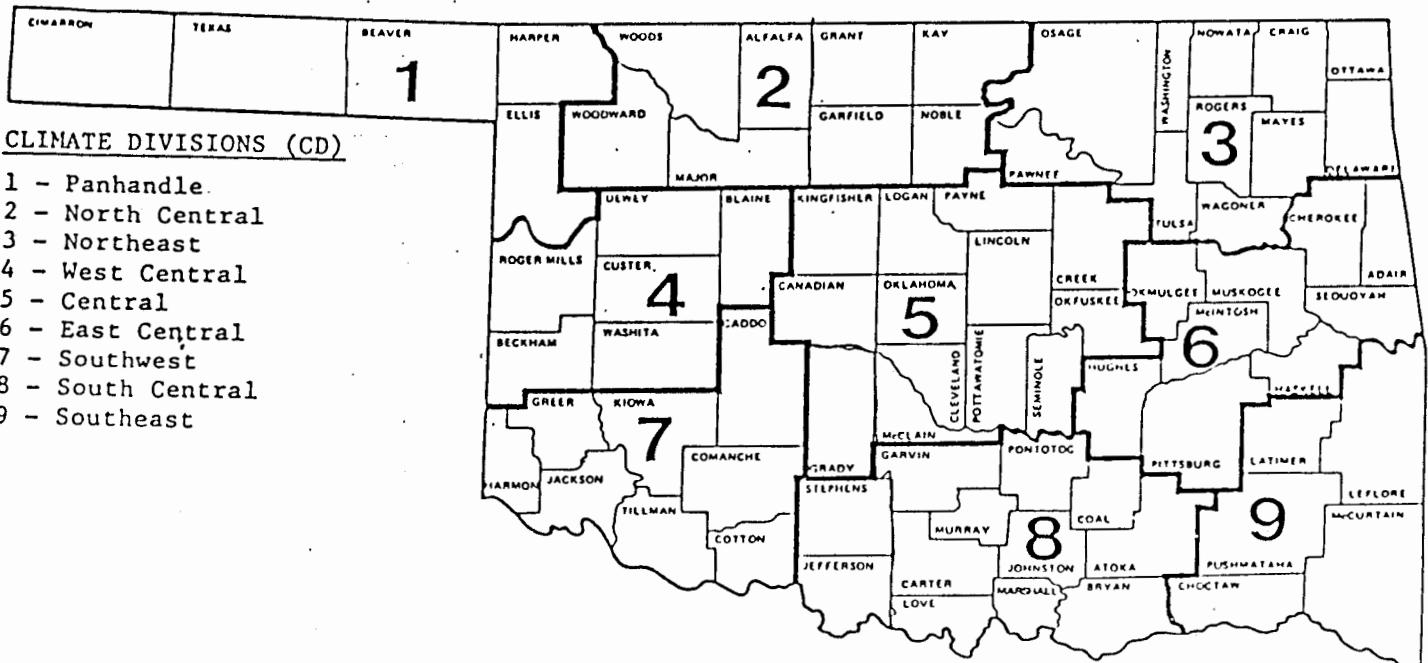

TABLE OF 1987/1988 COMPARISONS

Station	February Temperatures		February Precipitation	
	1987	1988	1987	1988
Arnett	42.5	36.9	2.820	.051
Enid	44.7	39.7	3.650	.192
Mutual	42.5	36.6	2.631	.016
Tulsa	45.8	40.0	3.475	1.031
Elk City	43.6	41.3	3.643	.073
Oklahoma City	46.2	40.5	4.725	.414
McAlester	47.3	42.0	4.122	1.143
Altus Irr. Sta.	48.1	42.0	2.852	.100
Durant	48.2	42.0	4.600	2.040
Ada	47.1	43.6	5.681	.682
Antlers	49.5	46.8	3.020	1.640

EXTREMES

Maximum 24-hour precipitation	Bokchito	8	2.00"	17

O K L A H O M A

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

Station Name:

Station Identification Number: These are usually assigned by the National Climatic Data Center.

Climate Division: See the figure above.

Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and summed. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

29

$$\sum_{i=1}^{65} \frac{(TMAX_i + TMIN_i)}{2}$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and summed. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i)/2) - 65$$

Deviation from normal cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

EXPLANATION OF MAPS

To give a Statewide perspective, a series of maps is produced each month from the information contained in the station tables. Each map is calculated using between 50 and 200 observations. Only stations with complete monthly records are used. Each observation is put into one of three categories and assigned a plus (+), minus (-), or a dot (.). The minus is the lowest numeric category, the dot is the middle and the plus the highest numeric category. If a map location has no report, a value is estimated. Each map is accompanied by its own legend. The categories will vary from month to month throughout the year. The categories for the deviations from normal maps will always remain constant. This is to facilitate comparisons between months and across years.

30-YEAR MEAN APRIL MAXIMUM TEMPERATURE

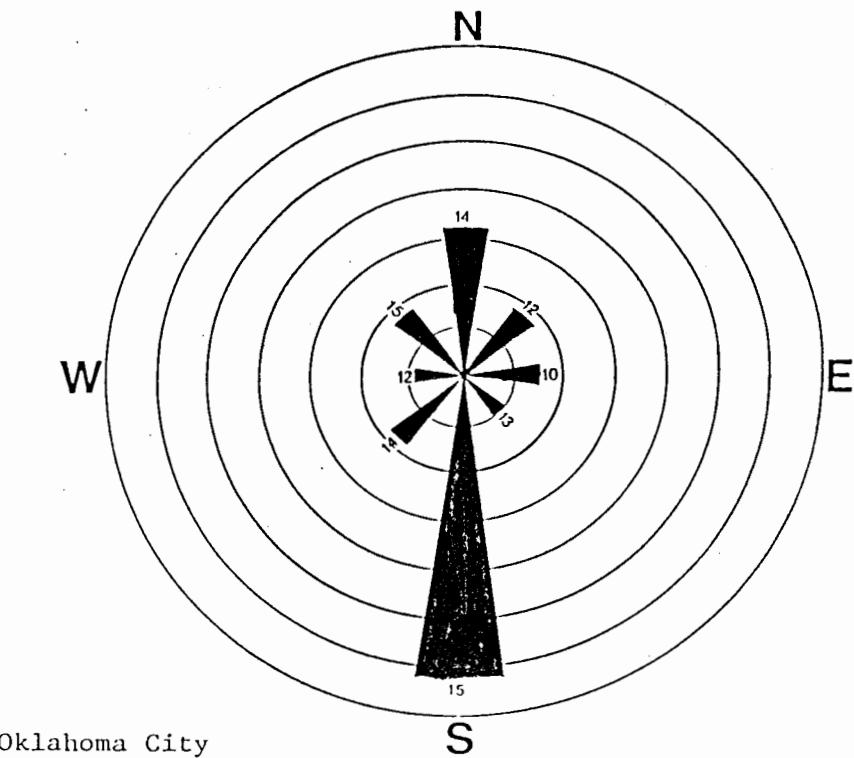

30-YEAR MEAN APRIL DAILY MINIMUM TEMPERATURE

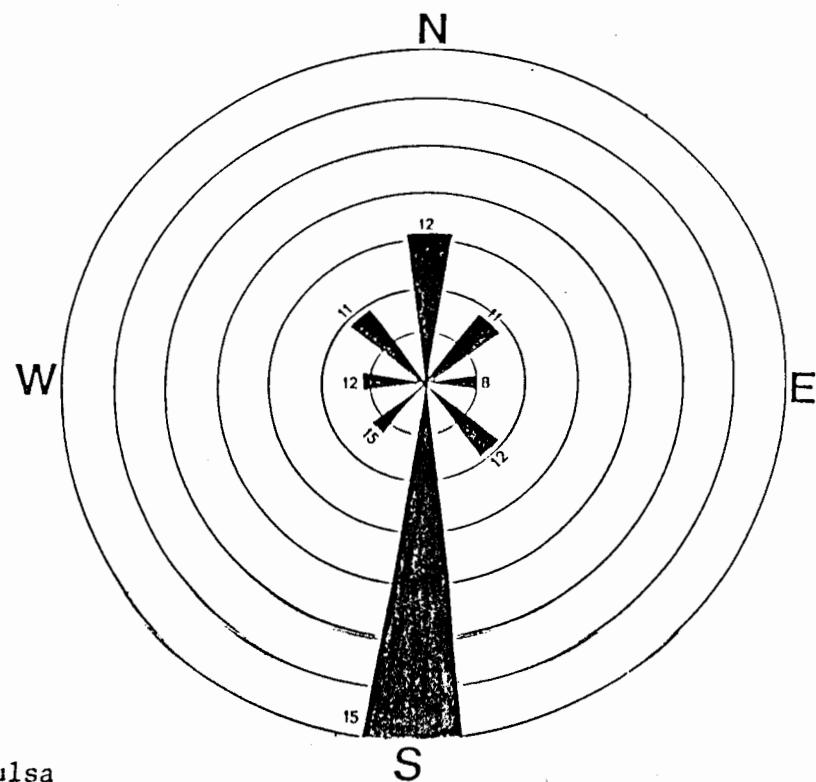

30-YEAR MEAN APRIL PRECIPITATION

April wind roses for Oklahoma City and Tulsa for 10-year (1965-1974) mean winds (data adapted from NOAA Airport Climatology Series). Percents represent the percentage of winds coming from a direction. The numbers at the end of the bars indicate the average speed of winds from that direction. Graphics by Tim Johnson.

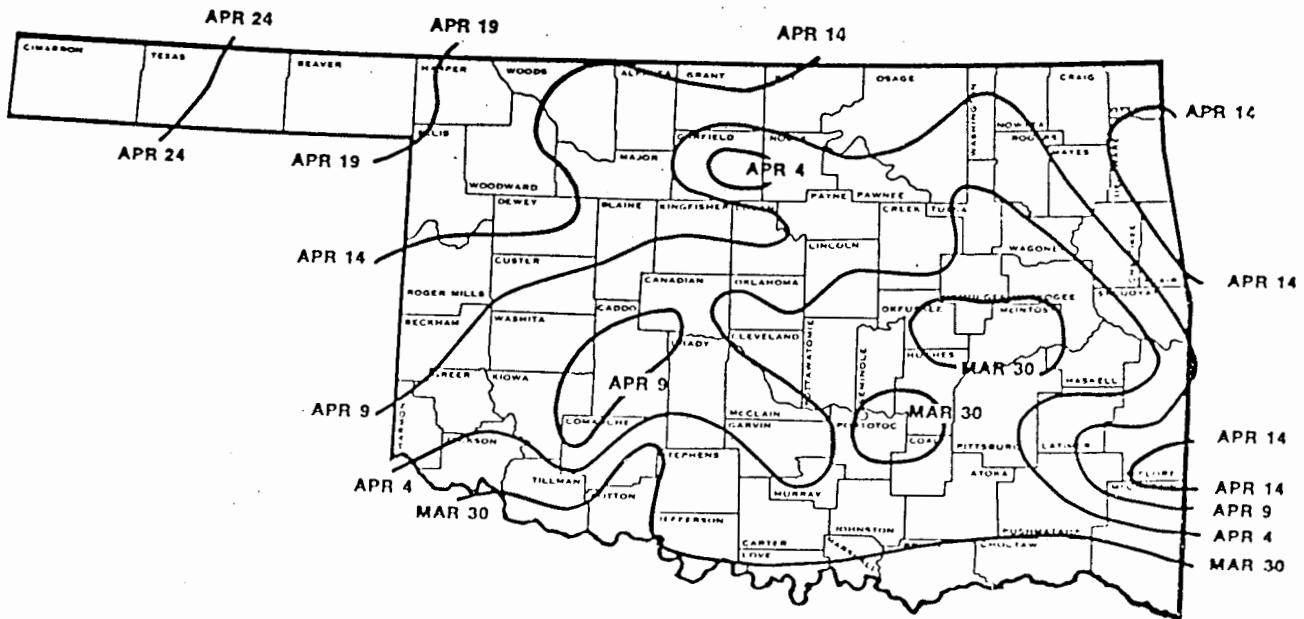

Oklahoma City

Tulsa

The tremendous agricultural interest endemic to Oklahoma renders climatological information vital to the State. The importance of this information is magnified during and shortly following the sowing season. The following map and table provide examples of valuable data including spring freeze-date probabilities. (Map and data via OSU extension publication "Freezing Temperatures in Oklahoma".)

Mean occurrence date of last 32° (F.) temperature in Spring.

Probability of Spring Temperature Thresholds
for Selected Oklahoma Stations

Climate Division	Station	Temp (Deg F)	Percent Probability of Indicated (or Lower) Temperature Occurring After Indicated Date		
			90%	50%	10%
1	Buffalo	32	Apr 3	Apr 18	May 4
		28	Mar 18	Apr 5	Apr 22
2	Enid	32	Mar 21	Apr 4	Apr 17
		28	Mar 11	Mar 26	Apr 9
3	Bartlesville	32	Mar 23	Apr 8	Apr 23
		28	Mar 18	Mar 31	Apr 13
