OCTOBER 1989 OKLAHOMA SUMMARY

October Statewide temperature averaged above normal for the first time since April 1989. Despite a frost-producing, very cool week during the middle of the month, Oklahoma experienced its first October with above normal temperatures since 1983, and only its second of the decade. Precipitation amounts varied greatly across the State but averaged below normal (see Map 1). Only two weather systems produced significant precipitation.

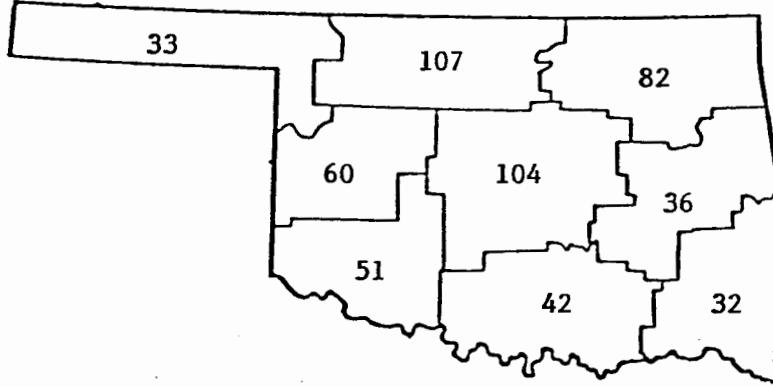

A fast-moving cold front produced powerful thunderstorms in western Oklahoma on October 5. Thunderstorm winds in excess of 80 mph on October 6 uprooted trees and damaged businesses and mobile homes in Grady County. Many stations in the State's northwestern half reported over an inch of rain, including over 3 inches at some north central stations. Several area stations received no other measurable precipitation throughout October. The front also brought 10 to 15 degree cooler air into the State. Slightly below normal temperatures persisted until October 9 when another warm air mass boosted temperatures Statewide.

Below normal temperatures returned on the 16th when the leading edge of the coldest Arctic air mass of the season entered Oklahoma. Temperatures dropped sharply behind the front. Many stations experienced their lowest temperatures of the month and two consecutive frosts on the 19th and 20th of October. Five-day temperatures averaged 10 to 15 degrees below normal through October 20 (see Fig. 1). Precipitation was limited to .10 to .50 inches in southeastern Oklahoma where the front encountered moisture from the remnants of Hurricane Jerry.

The prolonged dry weather caused soil moisture to drop to its lowest level since mid-spring, and slowed development of late-maturing row crops. Finally, a violent cold front delivered valuable precipitation to much of the State on October 29 and 30. Rainfall amounts exceeding 2 inches in CD's 3, 5, 7 and 8 ended a rainless period of over 45 days at some locations. The State-averaged topsoil moisture level rose over 30%. The powerful storm system also produced a tornado in Tillman County on the 29th, and three reported funnels in Kiowa County. Golfball-size hail was reported in Greer and Jackson Counties. Storm damage included downed power lines and uprooted trees in Stephens County.

R. J. Sladewski

Map 1. October 1989 percent of normal precipitation.

Oklahoma City's mean daily temperature remained above normal during most of October. The cold air mass on the 19th, however, did produce temperatures which were over 20 degrees below normal.

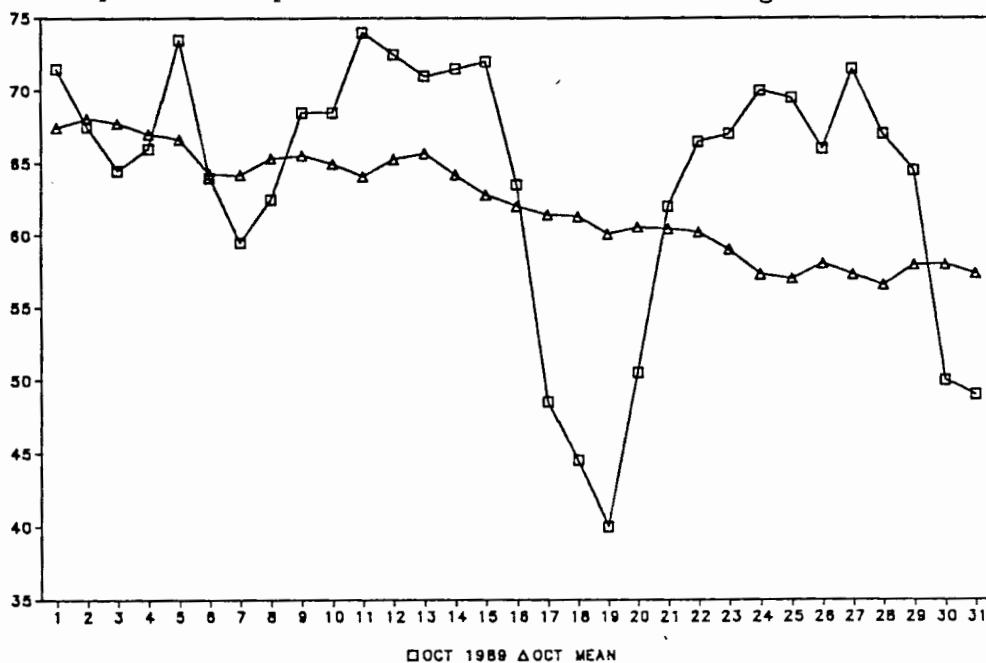

Fig. 1. Oklahoma City October daily temperature long-term mean compared to 1989.

TABLE OF 1988/1989 COMPARISONS

Station	October		October

TORNADO CLIMATOLOGY INFORMATION AVAILABLE

The Oklahoma Climatological Survey recently developed software which analyzes the National tornado database provided by the National Severe Storms Forecast Center. The resulting tornado climatology provides valuable tabular and graphical information regarding movement, intensity of the tornadoes, dollar damage estimates, and date, time and duration of the event. One popular product is the county tornado map (see Map 2). The solid lines represent tornado path and the asterisks indicate the path endpoint. The boundary, in this case, is Osage County, OK. Similar maps along with accompanying data tables for the entire U.S., by county, state or region can be purchased from the Survey. Price list available on request.

Map 2. Osage County, OK Tornado Path Map,
1950-1988.

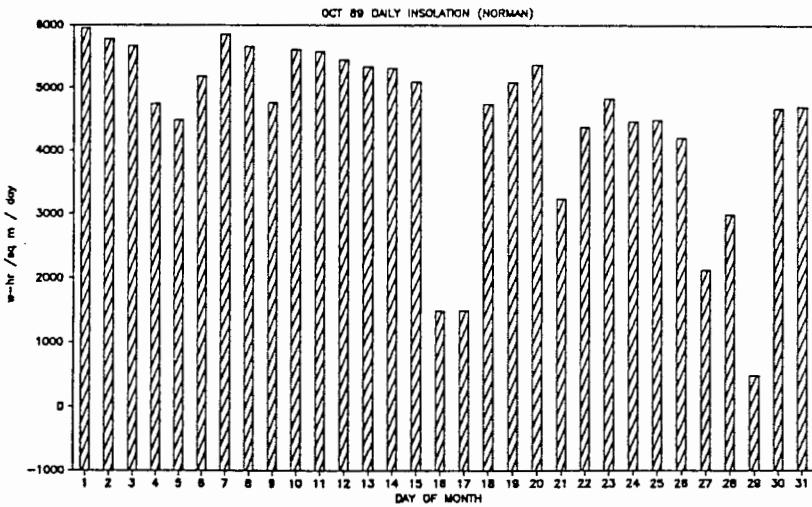

INSOLATION DATA AVAILABLE

The University of Oklahoma's School of Meteorology is observing and archiving incoming solar radiation data as part of a cooperative effort with the Agricultural Research Service, USDA at Durant, OK. The observation site, operated continuously since September 1987, is located at Max Westheimer Airport in Norman. The data are representative of central Oklahoma and available through the Oklahoma Climatological Survey. The table and chart below depict the October 1989 daily observations.

December wind roses for Oklahoma City and Tulsa for 10-year (1965-1974) mean winds (data adapted from NOAA Airport Climatology Series). Percents represent the percentage for winds coming from a direction. The numbers at the end of the bars indicate the average speed (miles per hour) of winds from that direction.

Temperature - Near Normal Statewide

90-DAY OUTLOOK (NOVEMBER-JANUARY)

Precipitation - Above Normal in Eastern Oklahoma
Near Normal Elsewhere
Temperature - Below Normal Statewide

-18-

O K L A H O M A

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

Station Name:

Station Identification Number: These are usually assigned by the National Climatic Data Center.

Climate Division: See the figure above.

Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and summed. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

$$29 \sum_{i=1}^{65} ((TMAX_i + TMIN_i)/2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and summed. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i)/2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

EXPLANATION OF MAPS

To give a Statewide perspective, a series of maps is produced each month from the information contained in the station tables. Each map is calculated using between 50 and 200 observations. Only stations with complete monthly records are used. Each observation is put into one of three categories and assigned a plus (+), minus (-), or a dot (.). The minus is the lowest numeric category, the dot is the middle and the plus the highest numeric category. If a map location has no report, a value is estimated. Each map is accompanied by its own legend. The categories will vary from month to month throughout the year. The categories for the deviations from normal maps will always remain constant. This is to facilitate comparisons between months and across years.

DECEMBER 1989 CLIMATE CALENDAR

The data on this calendar are for Oklahoma City. Normal values are calculated for the period 1948-1987. Extremes are found for the period of record (1924-present).
