FEBRUARY 1992 OKLAHOMA SUMMARY

There's no other way to state it, the groundhog was just plain wrong. Despite the February 2nd prediction of six more weeks of winter, mild weather prevailed throughout most of the month. Although few records were set, consistently mild weather made this the 5th warmest February among 101 years of statewide records. Preliminary data indicate a statewide-average temperature of 48.5 degrees, which is 7.2 degrees above the 1961-1990 normal. Every climate division (CD) was at least five degrees above normal, and northeast, central and east central Oklahoma (CD's 3,5 and 6) were over seven degrees above normal.

Dry conditions accompanied the warm weather. There were few reports of daily precipitation totals exceeding an inch anywhere in the state. The statewide average of 1.18 inches was 0.55 inch below normal. The driest areas were in northwest and north central Oklahoma, where less than half the normal February precipitation was recorded. Only the northeast corner of the state received above-normal precipitation.

The month began with near-record warmth across northeastern Oklahoma, where maximum temperatures climbed into the mid 70's at several locations. The mild weather was also reflected in the overnight low temperatures, as reporting station in the state remained above freezing on the 3rd. A cold front quickly ended the mild weather on the 4th, and dropping temperatures into the teens across northern sections of the state. Chandler reported a low of 12 degrees on the 8th, the minimum reported temperature of the month.

Cool air remained entrenched across northern Oklahoma for the next few days, where maximum temperatures were held to the 40's, vastly different from the sixty-degree plus readings reported in southern Oklahoma. Minimum temperatures quickly recovered to near or above freezing statewide however. A slow-moving storm system brought cloud cover and precipitation to eastern Oklahoma from the 11th through the 14th. The heaviest rains of the month came on the 12th, with Lehigh, Daisy and Atoka all reporting over two inches. There were also reports of large hail from Carter, Garvin and Jefferson counties the evening of the 11th.

Spring-like warmth gradually returned to much of the state over the following week. By weeks end, temperatures had reached the 70-degree mark over large portions of southern Oklahoma and were generally in the upper 50's or 60's across northern Oklahoma. Another cold front passed slowly through the state on the 24th, dropping maximum temperatures into the 30's and 40's and minimum temperatures to as low as 19 degrees at Guymon on the 25th. However, the cold snap was short-lived as temperatures soared into the 80's in southwest Oklahoma and the 70's elsewhere to close out the month.

- 3 - Northeast
- 4 - West Central
- 5 - Central
- 6 - East Central
- 7 - Southwest
- 8 - South Central
- 9 - Southeast

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

Station Name:

Station Identification Number: These are usually assigned by the National Climatic Data Center.

Climate Division: See the figure above.

Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and summed. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

$$29 \sum_{i=1} 65 - ((TMAX_i + TMIN_i) / 2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and summed. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i)/2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

OKLAHOMA CITY CLIMATE CALENDAR

April 1992

The data on this calendar are for Oklahoma City.
Normal values are calculated for the period
1961-1990. Extremes are found for the period
of record (1891-present).
