## **MONTHLY SUMMARY FOR DECEMBER 1993**

December statewide averages during 1993 show the month to have been both warmer and wetter than normal. Precipitation was distributed unevenly across the state, however, as seven-inch rains in southeastern Oklahoma produced local flooding early in the month while the state's far northwestern counties were experiencing their seventh consecutive month of below normal precipitation. Above normal temperatures prevailed across the state in the absence of major outbreaks of cold air.

The statewide average precipitation for the month of 1.88 inches was .22 inch above normal. The December precipitation brought the annual total for the state to 38.66 inches. 1993 precipitation across the state was 4.42 inches above normal, ranking as the 25th greatest statewide precipitation since 1892. The state's northwestern and west central climate divisions, however, received less than 75 percent of their normal May through December precipitation, leaving them with a deficit of about four inches over the last two-thirds of the year.

December temperatures averaged 42.4 degrees, 2.9 degrees above normal. The cooler than normal first half of the year combined with a mild autumn offset the hot summer to make 1993 the 11th coolest year on record for the state. The average temperature for the year of 59.2 degrees was 1.2 degrees below normal.

A low pressure system, which developed just south of the Red River, produced locally heavy rains in southeastern Oklahoma early on the morning of the 3rd. Precipitation in excess of 7 inches was reported in the vicinity of Broken Bow and Idabel. Several schools closed in southern McCurtain County due to high water and some Idabel residents were forced to evacuate.

A mild period, featuring an 80 degree afternoon in Erick on the 9th, ended abruptly in western Oklahoma when a strong cold front crossed the state just before the middle of the month. Strong thunderstorms developed in southwestern Oklahoma on the afternoon of the 12th. Hailstones in excess of three-quarters of an inch were reported in several southwestern counties. Instruments at an Oklahoma Mesonet station near Hollis (Harmon County) recorded a wind speed of 74 miles per hour.

A mixture of rain and snow, accompanied by very strong northerly winds, peppered the Panhandle on the evening of the 12th as the front moved southward. The Mesonet station at Goodwell recorded a wind speed of 73 miles per hour. Gusts in excess of 50 miles per hour were felt for several hours in the Panhandle and, following the frontal passage, as far south as Tipton in Tillman County on the 13th. Light snow was reported in northeastern Oklahoma, with accumulations of less than one-half inch reported at Kansas (Delaware County) and Spavinaw (Mayes County).

Weather for the remainder of the month was uneventful. Freedom reported daily minimum temperatures of less than 10 degrees daily from the 21st through the 25th. Light to moderate snow, accompanied by 35 mile-per-hour winds, was reported in Cimarron County on the 23rd. Hooker (Texas County) reported one-half inch of snow and light snow was reported in Beaver County. Cold air across the state on the 28th kept temperatures across much of northern and western Oklahoma in the 20s on the 28th and 29th. Blackwell (Kay County) and Billings (Noble County) each reported a trace of snow.

Howard L. Johnson

## CLIMATE DIVISIONS (CD)

- 1 - Panhandle
- 2 - North Central
- 3 - Northeast
- 4 - West Central
- 5 - Central
- 6 - East Central
- 7 - Southwest
- 8 - South Central
- 9 - Southeast

## EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

Station Name:

Station Identification Number: These are usually assigned by the National Climatic Data Center.

Climate Division: See the figure above.

Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and the average temperature for the day exceeds 65 degrees. Daily values are summed to arrive at a monthly total. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

$$\sum_{i=1}^{29} 65 - ((TMAX_i + TMIN_i) / 2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and the average temperature for the day is less than 65 degrees. Daily values are summed to give a monthly total. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i) / 2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

OKLAHOMA CITY CLIMATE CALENDAR

The data on this calendar are for Oklahoma City.  
 Normal values are calculated for the period  
 1961-1990. Extremes are found for the period  
 of record (1891-present).

February 1994
