MONTHLY SUMMARY FOR AUGUST 1996

Most Oklahomans were treated to wet and cool weather during August. Above average rainfall and lower than normal temperatures were the feature, although some areas in northeastern Oklahoma still were showing the effects of the recent extended dry weather. Statewide-averaged precipitation was 5.49 inches, 2.67 inches greater than normal. This was the 6th greatest August precipitation total since records begin in 1892. Meanwhile, temperatures across the state averaged 78.0 degrees, 2.8 degrees lower than normal, making this the 12th coolest August in 105 years.

Annual-to-date precipitation for the state through August is 22.85 inches. The plentiful rains of July and August have brought the state total to only .29 inch below normal. The year-to-date precipitation ranks as the 49th lowest on record. The summer months total precipitation of 15.22 inches is 5.83 inches greater than normal, the 6th greatest summer precipitation on record. The state was still 4.02 inches short of normal precipitation since October 1, 1995 and the effects of the drought lingered in parts of the northeast where some precipitation totals since last October were as much as 15 inches lower than normal.

Despite the heat wave of early July, the summer average temperature of 79.0 degrees was 1.0 degree lower than normal and ranks as the 26th lowest summer temperature in Oklahoma. The year-to-date temperature of 62.1 degrees, 0.3 degree less than normal, ranks 40th on the low end of the all-time January through August temperature list.

Only two days during the month passed without at least one station reporting an inch or more of rain, and the greatest reports on those two days exceeded one-half inch. After the 8th cool, cloudy weather prevented the triple-digit temperatures that so frequently mark August in Oklahoma after the 8th. Even during the first week of the month, 100-degree-plus readings were confined mainly to those areas in southwestern Oklahoma that had not yet received their drought-breaking rains. Chattanooga (Comanche County) was the hot spot during that period, reporting daily maximum temperatures in excess of 100 degrees from the 2nd through the 7th, peaking at 106 degrees on the 4th.

Thunderstorm-related winds and hail affected parts of northwestern and central Oklahoma on the 1st, 2nd and 3rd. One and three-quarter inch hail was reported in Kingfisher County on the 2nd. Local flooding was reported at Woodward (Woodward) and the Cimarron River briefly overflowed its banks near Waynoka (Woods) on the 3rd. Local flooding was reported near Okeene (Blaine) on the 7th and in Cordell (Washita) and at Turner Falls (Murray) on the 9th.

A small tornado touched ground just west of Walters on the 11th. The tornado was part of a storm system that dropped golfball-sized hail in Greer, Dewey, Custer and Stephens counties and produced very strong winds in the southwest.

Very strong thunderstorms on the 17th produced a small tornado west of Perry (Noble) and 6.68 inches of rain, accompanied by golfball-sized hail and 70 mile-per-hour winds at Pawhuska (Osage). A tornado was reported northwest of Cyril (Caddo) on the 22nd and large hail and strong winds peppered Owasso (Tulsa) on the 22nd.

Locally heavy rain on the 28th caused flooding in and around Lawton (Comanche) and Granite (Greer). Bokchito (Bryan) also reported 5 inches of rain that day.

Howard L. Johnson

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

- Station Name:
- Station Identification Number: These are usually assigned by the National Climatic Data Center.
- Climate Division: See the figure above.
- Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.
- Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.
- Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.
- Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.
- Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and the average temperature for the day is less than 65 degrees. Daily values are summed to arrive at a monthly total. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

$$\sum_{i=1}^{29} 65 - ((TMAX_i + TMIN_i) / 2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and the average temperature for the day exceeds 65 degrees. Daily values are summed to give a monthly total. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i) / 2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

TULSA CLIMATE CALENDAR

OCTOBER 1996

The data on this calendar are for Tulsa. Normal values are calculated for the period 1948-1992; Temperature extremes are for the period 1905-1994; precipitation extremes are for the period 1948-1994.
