MONTHLY SUMMARY FOR MARCH 1997

According to preliminary data from the National Weather Service, Oklahoma was warmer and significantly dryer than normal during March. The western third of the state particularly was lacking in moisture during a month in which the state's average reporting station received 1.15 inches of precipitation, 1.66 inches less than normal and the 21st lowest March total since 1892. Buttressed by a warm period near the end of the 3rd week of the month, the statewide average temperature of 53 degrees topped the normal value by 2.3 degrees, ranking this as Oklahoma's 29th warmest March. Overall statistics during the first three months of 1997, indicate that the state, as a whole, has experienced near-normal total precipitation and greater than normal temperatures. The January through March precipitation of 5.79 inches is 0.02 inch less than normal. The average temperature during the first quarter of the year, 44.5 degrees, is 1.6 degrees greater than normal.

The weather during the first ten days of the month was rather unremarkable. A series of weak cold fronts moved through the state, keeping daily low temperatures in the teens and 20s in the north and the 30s and 40s in the south. Heavy thunderstorms in extreme southeastern Oklahoma produced 1.75 inch-diameter hail near Hugo (Choctaw County). Large hail was also reported in Pushmataha, LeFlore, and McCurtain counties. A total of 2.93 inches of rain fell at the Hugo Mesonet site on the 1st and 2nd, but rainfall amounts in the southeast were generally between one and two inches. Rain in northeastern Oklahoma on the 9th and 10th measured 1.50 inches at Scrapper (Cherokee), but only a handful of locations reported as much as an inch.

A much stronger cold front moved through the state on the 13th, producing significant rain in the southeast, including 2.50 inches at Smithville (McCurtain), 2.44 inches at Battiest (McCurtain), 2.37 inches at the Mesonet site east of Broken Bow (McCurtain), and 2.35 inches at the Cloudy (Pushmataha) Mesonet site. Cold air and strong winds dominated the state after the front's passage. Peak winds in excess of 50 miles per hour were recorded at Mesonet stations near Hinton (Caddo), Medicine Park (Comanche), and Minco (Grady) on the 14th. The average wind speed at each of those sites on the 14th was approximately 24 miles per hour. The lowest temperatures of the month were recorded on the 14th at the Slapout (Beaver) Mesonet site (14 degrees), the Hooker (Texas) Mesonet site (15 degrees), and by the Freedom (Woods) NWS cooperative observer (15 degrees).

Strong southerly winds and warm, dry weather dominated the state from the 21st through the 24th. Altus (Jackson) reported the month's highest temperature (98 degrees) on the 21st. The warm spell produced conditions ripe for wild fires in northeastern Oklahoma. Approximately 250 fires were reported, primarily east of the Neosho River. Nineteen of the 114 stations of the Oklahoma Mesonet recorded daily-average wind speeds in excess of 20 miles per hour on the 24th. Strong thunderstorms formed in central Oklahoma late on the 24th and moved across the eastern half of the state overnight, producing some hail and high winds while also providing sufficient moisture to end the fire danger. Eyewitnesses reported a small tornado near Terlton (Pawnee) that destroyed a mobile home. The Mesonet site at Pawnee (Pawnee) recorded a peak wind of 73 miles per hour.

A round of thunderstorms in north central and northeastern Oklahoma on the 27th produced large hail, including an oblong hailstone measuring 4.75 inches long and 2.75 inches wide that fell in Tulsa. An small tornado reportedly touched down briefly near Watonga (Blaine). More thunderstorms formed in southwestern Oklahoma on the 27th, producing large hail and high winds, but no reports of precipitation greater than 0.53 inch.

- 8 - South Central
- 9 - Southeast

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

Station Name:

Station Identification Number: These are usually assigned by the National Climatic Data Center.

Climate Division: See the figure above.

Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and the average temperature for the day is less than 65 degrees. Daily values are summed to arrive at a monthly total. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

$$\sum_{i=1}^{29} 65 - ((TMAX_i + TMIN_i) / 2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and the average temperature for the day exceeds 65 degrees. Daily values are summed to give a monthly total. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i) / 2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

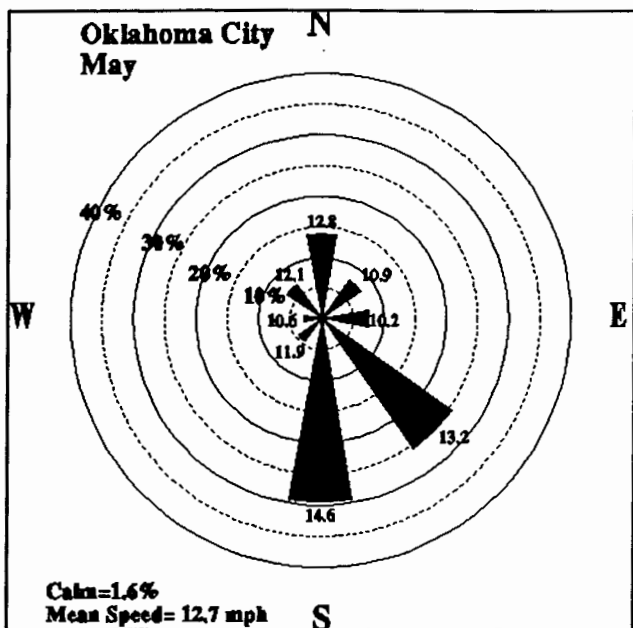

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

May Wind Roses for Oklahoma City and Tulsa. The frequency (percent) of winds from each direction is represented by length of its bar. The numbers at the ends of the bars indicate the average wind speed from that direction in miles per hour.
