MONTHLY SUMMARY FOR JULY 1998

Blistering heat and sparse rainfall dominated the July weather picture over most of Oklahoma. Daily maximum temperatures exceeded 100 degrees somewhere in the state every day during the month, and the southern two-thirds of the state settled uncomfortably into a drought pattern reminiscent of the 1930s or 1950s. Rainfall was abundant in the state's northern third, enough so that the statewide-averaged monthly precipitation, based on preliminary data from the National Weather Service, of 2.54 inches was only 0.08 inch less than normal. This July ranks as the 47th driest July since 1892. Temperatures were higher than normal throughout the state, averaging 86.3 degrees, statewide. The July average temperature was 4.2 degrees higher than normal and ranks this as the 4th hottest July (trailing only 1954, 1934, and 1980 in that order) through the 107 years of record.

July fit only too well within the spring and early summer of 1998 context of much above average temperatures coupled with less than normal precipitation. January through July, with temperatures averaging 61.2 degrees across the state, was 1.5 degrees hotter than normal, to rank as the 22nd hottest such period on record. More startlingly, 1998 had the state's 11th warmest April- through-July, its 2nd hottest May-through-July (trailing only 1934), and its 5th warmest June and July combined. Concurrently, statewide precipitation for the year-to-date is 20.02 inches, only 0.30 inches below normal, to rank as the 52nd driest. However the April-through-July rainfall (9.54 inches, 4.58 inches less than normal) is the 3rd lowest on record, the May-through-July total (6.87 inches, 4.56 inches lower than normal) ranks as 5th lowest, and June-July precipitation (4.31 inches, 2.26 inches below normal) ranks as 15th lowest. The state's southwest and south central climate divisions each have suffered through the driest and hottest April through July period of the 104 years for which regional records are available.

The month started with a state burn-ban declaration in force in 13 western counties and ended with 66 counties under a federally-declared drought and heat emergency. Fifteen people died from heat-related causes, raising the total for the heat wave that started in late June to 17. Wild fires of a magnitude unknown to Oklahoma plagued the heavily forested southeast. According to the Forestry Services Division of the Oklahoma Department of Agriculture, approximately 340 separate fires burned over 14,000 acres of timberland during July. The worst previous July during the last 25 years (1980) saw approximately 5,000 acres destroyed by about 270 fires. Many of this year's fires crowned (i.e., the fire spread mainly by way of the tops of the trees rather than through the underbrush as is usual in Oklahoma forest fires) making them impossible to fight from the ground. Unfortunately, it appears that many of the worst fires were set intentionally and others were caused by human activities despite the presence of a state-imposed ban on burning in the affected areas.

Summer-planted crops also suffered greatly. Oklahoma is expected to harvest its smallest cotton crop since 1895, although the irrigated fields (the only ones likely to be harvested) are producing record yields. Peanuts, hay, and other crops have been decimated in the drought-stricken areas. Many producers are reducing their cattle herds and hay is being shipped in to feed the remainder as pastures generally are unable to provide adequate nutrients. Many communities imposed water rationing as demand, frequently for lawn-watering, outstripped the abilities of the treatment and distribution systems to provide supplies of fresh water.

The northern third of the state received several good rains during the first half of the month and again during the final week. Local flooding was reported in western Kay County and along the Neosho and Spring rivers in Ottawa County on the 1st. Severe weather was limited to some spotty wind damage and isolated hail storms on the 7th, 10th, 13th, and 15th, mostly in northwestern Oklahoma.

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

- Station Name:
- Station Identification Number: These are usually assigned by the National Climatic Data Center.
- Climate Division: See the figure above.
- Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.
- Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.
- Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.
- Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.
- Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and the average temperature for the day is less than 65 degrees. Daily values are summed to arrive at a monthly total. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

$$\sum_{i=1}^{29} 65 - ((TMAX_i + TMIN_i) / 2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and the average temperature for the day exceeds 65 degrees. Daily values are summed to give a monthly total. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i) / 2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

OKLAHOMA CITY CLIMATE CALENDAR
DATA COURTESY OF NATIONAL WEATHER SERVICE NORMAN

SEPTEMBER

The data on this calendar is for Oklahoma City.
Normal values are calculated for the period 1961-1990.
Temperature extremes are for the period 1891-1997
Precipitation extremes are for the period 1891-1997
