MONTHLY SUMMARY FOR MARCH 1998

March 1998 was cool and very wet in Oklahoma. According to preliminary data from the National Weather Service, monthly precipitation across the state averaged 5.44 inches (2.63 inches greater than normal), the third highest March precipitation in the state since 1892. The statewide-averaged temperature of 46.3 degrees (4.4 degrees lower than normal) ranks this as the 20th coolest March over the 107 years of available data. The precipitation, which included substantial snow storms, persistent widespread rains and locally-heavy thunderstorms, brought the year-to-date statewide-averaged precipitation to 10.48 inches, 4.67 inches ahead of normal and the fourth largest January through March precipitation on record. The cool month partially offset the mild first two months of the year to provide the state with its 47th warmest January through March. The 3-month average temperature of 43.7 degrees was 0.8 degree above normal.

The month's significant weather began on the 5th when a thunderstorm at Tom (McCurtain County) produced hailstones one-and-three-quarters inch in diameter. Other thunderstorms on the 6th and continuing into the early morning hours of the 7th produced large hail in Bryan, Oklahoma, and Comanche counties. Rain and snow spread across the state on the 7th. The Pryor Mesonet site (Mayes) recorded 3.82 inches of rain and Coleman (Johnston) reported 3.55. Measurable snowfall included 6 inches at Boise City (Cimarron) and 5 inches at Buffalo (Harper). Snow accumulations of three inches or more were commonplace in northwestern Oklahoma, but Kingston (Bryan) and Waurika (Jefferson), both in extreme southern Oklahoma, reported 2- and 1-inch snow accumulations, respectively. Bitter north winds hammered the state on the 8th and 9th, bringing with them frigid air. Sixty-three of the state's Mesonet stations recorded daily-average winds in excess of 20 miles per hour on the 8th, led by the Minco site (Grady) where the 24-hour average wind speed was 33.5 miles per hour. Temperatures descended into the sub-teens in much of the northwest, including 4 degrees at Fort Supply Dam on the morning of the 11th.

A second winter storm swept through the state on the 15th and 16th, introducing a week-long period of frequent and widespread rain that produced flooding in many areas of the state. Boise City acquired another 4 inches of snow, but rain prevailed elsewhere. Comanche (Stephens) accumulated 6.76 inches of rain over the period, as Allen (Pontotoc), Ketchum Ranch (Stephens), Calvin Mesonet (Hughes), Burbank Mesonet (Osage), Spencer (Oklahoma), Stillwater Mesonet (Payne), and Cherokee (Alfalfa) each also netted over 5 inches of liquid precipitation. Flooding was reported on Bird Creek at between Skiatook and Sperry in Tulsa County, along the Poteau River near Panama (LeFlore) and along the Cimarron, North Canadian, Washita, North Fork of the Red, and Deep Fork rivers. Roads and highways were closed in many parts of the state and the Cimarron River, while modifying its course, severely eroded the river bank at the community of Twin Lakes south of Crescent (Logan), destroying four homes and threatening others.

A cold front and its associated upper-air system produced damaging winds in south central Oklahoma on the 18th. Mesonet sites near Ninnakah (Grady) and Pauls Valley (Garvin) recorded 74 and 73 mile-per-hour peak winds, respectively, and wind damage was reported in Pauls Valley, Chickasha (Grady), and Blanchard (McClain). Over three inches of snow fell on the northwest on the 18th and 19th, including 11 inches at Boise City and 10 inches at Gate (Beaver).

Strong winds and warm weather provided enough drying to spark grass fires near Tahlequah (Cherokee) on the 25th. Temperatures in northwestern Oklahoma rose into the 90s, including a high of 94 at Gage (Ellis), and the Hooker Mesonet site (Texas) recorded a 63 mile-per-hour peak wind on the 26th. A thunderstorm in Ellis County produced three-quarter-inch hail on the 27th. Strong surface winds, enhanced by thunderstorms in some areas, caused widespread damage on the 27th, most noticeably in Okmulgee and Pittsburg counties. The winds at Hinton Mesonet (Caddo) averaged 28.7 miles per hour for the day to lead the 57 Mesonet stations that had daily average wind speeds in excess of 20 miles per hour.

One more winter storm impacted the state from late on the 29th through the 30th. Large hail was reported in much of south central Oklahoma, thunderstorm winds estimated at 70 miles per hour struck Chickasha and Daugherty (Murray). The Eufaula Mesonet site (McIntosh) reported a peak wind of 62 miles per hour. While many reporting stations were reporting an inch or so of rain, the Cimarron County reporting stations (Kenton, Regnier, and Boise City) were recording one-and-one-half to three inches of snow.

TEMPERATURE: Lower Than Normal Statewide

PRECIPITATION: Near Normal Statewide

May Wind Roses for Oklahoma City and Tulsa. The frequency (percent) of winds from each direction is represented by length of its bar. The numbers at the ends of the bars indicate the average wind speed from that direction in miles per hour.

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

**** A Note To Our Readers ****

One sure way to find out whether a readership like ours is paying attention is to make an error. We sincerely apologize for the erroneous climate calendars published with last month's data summary. We offer heartfelt thanks to the readers who noticed the error and, so tactfully and gracefully (I mean it), brought the matter to our attention. As part of our "do better" effort, we decided to try a more readable format for the calendars. As before, the data were obtained from the two National Weather Service offices in the state. We have merely re-formatted the information. We will be making other cosmetic changes to our formats throughout the summary as some of us "set-in-our-ways" oldtimers allow our bright younger associates to do some things their way. We haven't had a general face-lift in some time and one is due. Our goal is to continue producing a useful and readable, though improved, print summary that is accompanied by an electronic twin on the world wide web. The web version of the summary is probably several months away, but we are working on it. Thanks for your patience and for your readership. We appreciate all comments and suggestions - both flattering and otherwise.

Howard L. Johnson

OKLAHOMA CITY CLIMATE CALENDAR
DATA COURTESY OF NATIONAL WEATHER SERVICE NORMAN.

MAY

The data on this calendar is for Oklahoma City.
 Normal values are calculated for the period 1961-1990
 Temperature extremes are for the period 1891-1997
 Precipitation extremes for the period 1891-1997
