MONTHLY SUMMARY FOR JANUARY 1999

January was warmer than normal with greater than average precipitation. The statewide-averaged temperature of 39.6 degrees, 3.2 degrees greater than normal, is the 37th highest January temperature in Oklahoma since record-keeping began in 1892. The mild January was the 9th consecutive month, dating back to May 1998, that the statewide temperature has been greater than normal. Precipitation was noted primarily very early and very late in the month, but the totals were nonetheless sufficient to provide the state with greater-than-average precipitation for the 4th consecutive month. The statewide-averaged monthly total was 2.17 inches, 0.91 inch greater than normal, ranking this January as the 20th wettest of the 108 on record.

Several stations in McCurtain County reported over an inch of rainfall that fell on the 1st, including the Broken Bow Mesonet site (1.56 inches), Idabel (1.42 inches), Carnasaw Tower (1.28 inches), Carter Tower (1.20 inches), and Smithville (1.00 inch). Heavy thunderstorms brought large hail to parts of LeFlore, Latimer, Pushmataha, Choctaw, and Haskell counties on the 21st, including 1.75-inch-diameter hail reported at Wister (LeFlore County). Only Poteau (LeFlore) reported as much as an inch of rain. Dustin (Hughes) reported 1.55 inches of precipitation on the 23rd (some of it coming from the 2 inches of snow that fell), accompanied by 1.40 inches at Meeker (Lincoln) and 1.37 inches at Dewar (Okmulgee). Tulsa recorded a total of 3 inches of snow over the 22nd and 23rd.

A significant storm moved through state from the 28th through the 30th with most of the precipitation, in the form of rain and snow, occurring across northern Oklahoma. Four-or-more-inch snowfalls were reported in the western Panhandle, including 13 inches at Boise City (Cimarron), 12 inches at Regnier (Cimarron), and 10 inches at Hooker (Texas). Local flooding was reported in Kay County where Newkirk reported a total of 4.17 inches of precipitation over three days. Ponca City (Kay) received 3.47 inches of precipitation on the 31st, its greatest one-day precipitation total in January, at least since 1948. Newkirk's 3.15-inch report on the 31st was the greatest January daily precipitation total in that station's available record, dating back to 1900.

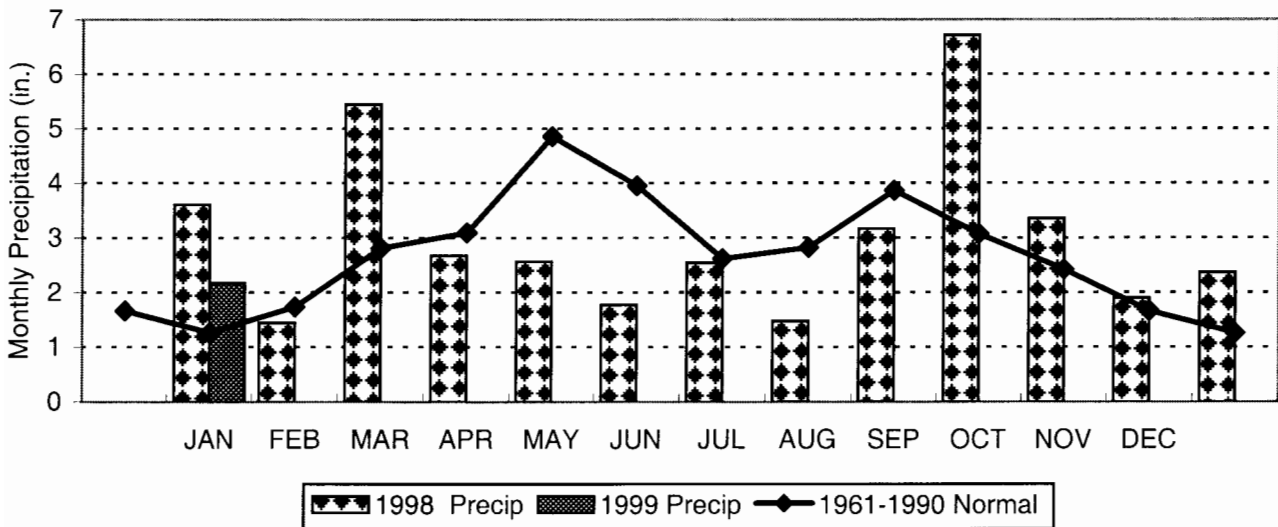

The month's lowest temperatures were recorded early in the month. Single-digit daily minimum temperatures were observed at many locations from the 2nd through the 9th. Fort Supply Dam (Woodward) recorded a minimum temperature of one degree below zero on the morning of the 3rd. Daily maximum temperatures climbed into the low 80s at a few locations in the southwest on the 20th and again on the 24th. Elk City (Beckham) reported a daily maximum of 82 degrees for the reporting period that included the afternoon of the 24th.

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

- Station Name:
- Station Identification Number: These are usually assigned by the National Climatic Data Center.
- Climate Division: See the figure above.
- Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.
- Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.
- Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.
- Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.
- Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and the average temperature for the day is less than 65 degrees. Daily values are summed to arrive at a monthly total. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

$$\sum_{i=1}^{29} 65 - ((TMAX_i + TMIN_i) / 2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and the average temperature for the day exceeds 65 degrees. Daily values are summed to give a monthly total. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i) / 2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

OKLAHOMA CITY CLIMATE CALENDAR
 DATA COURTESY OF NATIONAL WEATHER SERVICE NORMAN

MARCH

The data on this calendar is for Oklahoma City.
 Normal values are calculated for the period 1961-1990.
 Temperature extremes are for the period 1891-1997.
 Precipitation extremes are for the period 1891-1997.
