MONTHLY SUMMARY FOR DECEMBER 2000

The century year ended with a succession of winter storms that spread unusual amounts of ice and snow across Oklahoma and resulted in the state's coldest month since 1983. The statewide-averaged temperature of 30.8 degrees, 8.3 degrees less than normal, is the second lowest December temperature in the state record that begins in 1892. No intervening month since the December record-setter of 1983 has registered a lower average temperature. December was the second consecutive month with much-below-normal temperatures. The statewide averaged temperature for November and December, combined, of 37 degrees was 7.6 degrees less than normal. As a result the year 2000 is the proud possessor of the coldest November-December yet recorded for the state. Precipitation was dominated by three winter storms, the last and worst of which began on Christmas Day, bringing holiday travel to a virtual halt, leaving many without power and contributing substantially to at least 22 deaths. Monthly precipitation totaled 1.95 inches when averaged statewide, 0.29 inch greater than normal and the 33rd greatest December precipitation over the 109-year period of record.

Preliminary annual statistics portray a year that was slightly warmer (60.5 degree annual temperature, 0.3 degree greater than normal, 48th warmest) and wetter (36.84-inch annual precipitation, 2.60 inches greater than normal, 33rd greatest statewide-averaged precipitation) than normal. The year was unusual, as indeed they all are, in that the above normal temperature was obtained despite record cold November-December and the greater than normal precipitation came in the face of a severe two-month long drought (August-September).

The first of three important winter storm events swept through the state from the 11th through the 13th. The storm system blanketed much of the state with snow and provided a prophetic taste of freezing rain to the southeast while introducing a chill to the state that essentially remained through the end of the month. Hollow (Osage County) reported 13.5 inches of snow on the 13th and reports from Ketchum (Craig) indicated that as much as 13 inches fell in that area. Vinita (Craig), Pawhuska (Osage), and Bartlesville (Washington, but the reporting station is in Osage County) each reported 12 inches. Freezing rain in the extreme southeast (McCurtain, LeFlore, Choctaw, and Pushmataha counties) led to power outages affecting about 3,900 customers.

Temperatures in northern Oklahoma dipped into the single digits in the Panhandle on the 11th. Daily minimum temperatures ranged from the lower teens to below zero in the north for the remainder of the month. The Vinita Mesonet site (Craig) reported the month's lowest temperature (-8 degrees) on the 22nd. Occasional higher temperatures in other parts of the state were indicative of returning moisture and the approach of new onslaughts of winter weather. Strong winds raked western Oklahoma on several days, most extensively on the 16th when 29 Mesonet stations recorded maximum winds of 50 miles per hour or greater. The Mesonet station at Hooker (Texas) recorded a peak wind of 69 miles per hour on the 17th. Camargo (Dewey, 67 on the 16th), Goodwell (Texas, 64 on the 17th), and Minco (Grady, 61 on the 16th) also recorded maximum wind speeds exceeding 60 miles per hour.

The Christmas snow and ice storm that paralyzed much of the state, but was especially severe in the southeastern one-fourth, was the worst winter storm event to hit Oklahoma since Christmas week of 1987. Western areas of the state experienced snowfall of up to 9 inches (Sweetwater, on the county line separating Roger Mills/Beckham) and created a pleasant, though inconvenient, winter holiday scene. Farther east, however, a mixture of sleet and freezing rain created havoc. Travel was disrupted, or in some cases halted, beginning late Christmas Day. Ice collecting on tree limbs and power lines led to power outages in many areas. By one estimate, at least 170,000 homes and businesses, including 90 percent of the residents of McIntosh, Latimer, and Pittsburg counties, lost power as a result of the storm. Power still had not been restored in some areas as the month ended. Several McCurtain County locations reported a significant amount of precipitation (liquid-equivalent) over the three-day storm period, most notably: Valliant, 5.56 inches; Broken Bow, 5.14 inches; and Carnasaw Tower, 4.33 inches. Damage to trees from ice build-up was significant throughout the region. A third winter storm brought another 3 or more inches of snow to much of the state on the 30th and 31st. Konawa (Seminole) reported a 7-inch accumulation of new snow by the 31st. Twenty-two deaths between Christmas and New Year's Day, including a sledding accident and the drowning death of a child who broke through the ice on a frozen creek, were attributable to the weather.

OKLAHOMA

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

Station Name:

Station Identification Number: These are usually assigned by the National Climatic Data Center.

Climate Division: See the figure above.

Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and the average temperature for the day is less than 65 degrees. Daily values are summed to arrive at a monthly total. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 2000 HDD would be calculated as:

$$29 \sum_{i=1} 65 - ((TMAX_i + TMIN_i) / 2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and the average temperature for the day exceeds 65 degrees. Daily values are summed to give a monthly total. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$30 \sum_{i=1} ((TMAX_i + TMIN_i) / 2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as a mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from the monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24 hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

OKLAHOMA CITY CLIMATE CALENDAR
 DATA COURTESY OF NATIONAL WEATHER SERVICE NORMAN

MONTH February

The data on this calendar is for Oklahoma City.
 Normal values are calculated for the period 1961-1990.
 Temperature extremes are for the period 1891-1999.
 Precipitation extremes are for the period 1891-1999.
