## MONTHLY SUMMARY FOR NOVEMBER 2000

November was much cooler than normal throughout Oklahoma, while frequent, sometimes heavy, rains in the southeast pushed the statewide precipitation to greater-than-normal levels. The monthly temperature, averaged statewide, for November of 43.4 degrees, 6.4 degrees lower than normal, was the 3<sup>rd</sup> lowest November temperature recorded in Oklahoma since such records began in 1892. Statewide-averaged precipitation, buoyed by record monthly totals at several southeastern stations, was 3.68 inches (1.26 inches greater than normal), the 18<sup>th</sup> greatest November total in 109 years.

Autumn temperatures averaged 61.1 degrees across the state (0.5 degree less than normal, 40<sup>th</sup> coolest autumn on record). Precipitation during the season totaled 11.17 inches (1.74 inches greater than normal, 23<sup>rd</sup> largest). The first 11 months of the year 2000 have produced an average temperature of 63.3 degrees (1.1 degree greater than normal, 24<sup>th</sup> greatest January-November average temperature). Oklahoma accumulated a statewide-averaged precipitation of 34.89 inches from January through November (2.31 inches greater than normal) to rank this as the 35<sup>th</sup> wettest such period recorded in the state.

Cool weather prevailed most of the month and was well distributed across the state, as each of the state's nine climate divisions finished the month with temperatures at least 5.8 degrees lower than normal. According to the Oklahoma Mesonet, the 3<sup>rd</sup>, 4<sup>th</sup>, and 5<sup>th</sup> were the only dates with no sub-freezing temperatures reported. Temperatures during the month ranged from 82 degrees reported at Webbers Falls (Muskogee County) and Chandler (Lincoln) on the 1<sup>st</sup> to 11 degrees reported at Fort Supply on the 13<sup>th</sup>.

A significant early-season winter storm traversed the state from the 7<sup>th</sup> through the 9<sup>th</sup>, producing much of the month's precipitation, especially in the west, where monthly totals were less than the long term average for November. Sedan (Kiowa) recorded 7 inches of snow and Wann (Nowata) reported 6 inches, both on the 9<sup>th</sup>. Measurable snowfall was reported as far southeast as Madill and Kingston (Marshall) and flurries were seen in McCurtain County at Carnasaw Tower. The snowstorm capped a nine-day period of persistent rain in the southeast that produced more than 10 inches of precipitation across southern McCurtain County. The Idabel Mesonet site recorded 11.70 inches of rain over the period. The Broken Bow Mesonet station recorded 11.53 inches over the same period. Another round of extensive rainfall from the 22<sup>nd</sup> through the 25<sup>th</sup> delivered 6.33 inches of precipitation at Comanche (Stephens) and totals between 4 and 5 inches all across McCurtain County. By month's end, National Weather Service stations at Broken Bow, Carnasaw Tower, Carter Tower, Idabel, Smithville, and Valliant in McCurtain County and Comanche in Stephens County had all established new November precipitation records, based on data from 1948 until now.

Howard L. Johnson.

**CLIMATE DIVISIONS (CD)**

- 1 - Panhandle
- 2 - North Central
- 3 - Northeast
- 4 - West Central
- 5 - Central
- 6 - East Central
- 7 - Southwest
- 8 - South Central
- 9 - Southeast

**EXPLANATION OF TABLES**

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

**Station Name:**

**Station Identification Number:** These are usually assigned by the National Climatic Data Center.

**Climate Division:** See the figure above.

**Number of Temperature Observations:** These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

**Deviation from Normal:** The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

**Maximum Daily Maximum:** The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

**Minimum Daily Minimum:** The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

**Heating Degree Days:** HDD are calculated each day of the month for which there is a temperature report and the average temperature for the day is less than 65 degrees. Daily values are summed to arrive at a monthly total. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 2000 HDD would be calculated as:

$$29 \sum_{i=1} 65 - ((TMAX_i + TMIN_i) / 2)$$

**Deviation from Normal Heating Degree Days:** A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

**Cooling Degree Days:** CDD are calculated each day of the month for which there is a temperature report and the average temperature for the day exceeds 65 degrees. Daily values are summed to give a monthly total. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$30 \sum_{i=1} ((TMAX_i + TMIN_i) / 2) - 65$$

**Deviation from Normal Cooling Degree Days:** A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

**Total Precipitation:** Often incorrectly referred to as a mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

**Number of Precipitation Observations:** The number of days a rain or no rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

**Deviation from Normal Precipitation:** A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from the monthly total.

**Maximum 24-Hour Report and Day:** The maximum amount of precipitation recorded during the station's 24 hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

OKLAHOMA CITY CLIMATE CALENDAR  
 DATA COURTESY OF NATIONAL WEATHER SERVICE NORMAN

MONTH January

The data on this calendar is for Oklahoma City.  
 Normal values are calculated for the period 1961-1990.  
 Temperature extremes are for the period 1891-1999.  
 Precipitation extremes are for the period 1891-1999.
