ANNUAL SUMMARY FOR 1995

Widespread, frequent rainfall during spring and summer offset lower than normal winter and autumn precipitation to make 1995 Oklahoma's 26th wettest year since record keeping began in 1892. The total precipitation for the year, averaged statewide, was 38.23 inches, exceeding the state's normal annual precipitation by 3.99 inches. Timing of the rainfall produced hardships on agricultural interests. Heavy rains in May and June delayed the wheat harvest, leading to a reduction in yield due to disease, and forced the replanting of many spring-planted crops, especially cotton, contributing to reduced yields in those crops. Dry weather in many areas during the autumn reduced soil moisture to the extent that late plantings of winter wheat were slow to come to stand, preventing most growers from using the crop for winter forage for cattle. Seasonal precipitation for the year was: winter (including December 1994), 3.83 inches, 0.87 inch less than normal, ranking as the 38th lowest winter total; spring: 14.56 inches, 3.80 inches greater than normal, the 11th greatest springtime precipitation total; summer: 12.73 inches, 3.34 inches greater than normal, the state's 15th wettest summer; and autumn: 6.61 inches, 2.82 inches below normal, the 35th driest autumn since 1892.

The statewide-averaged temperature for the year was 60.1 inches, falling 0.2 inch less than normal and ranking as the 41st coolest year on record. A mild winter, the 13th warmest all-time, produced an average temperature of 42.7 degrees, 3.7 degrees greater than normal. The rainy spring was quite cool; the state averaged 57.9 degrees, 2.1 degrees less than normal, to rank as the state's 17th coolest spring. Temperatures during the summer months averaged 79.5 degrees, one-half degree less than normal, ranking 39th coolest. Despite the dry weather in autumn, the seasonal temperature of 60.9 degrees was 0.7 degrees below normal, ranking as the state's 34th coolest fall season.

The severe weather season was very active as 68 tornadoes were reported in the state during April, May and June. A total of 80 tornadoes were reported during the year, the 6th most confirmed tornadoes reported during any year since 1950, the year official record keeping began. The June total of 28 tornadoes was an all-time high for that month. The April total of 23 ranks 3rd on the all time list. No deaths were attributed to tornadoes within Oklahoma in 1995. Only eight tornadoes received intensity-scale ratings of F2 (significant tornadoes with estimated wind speeds of 113 to 157 miles per hour) or greater. The strongest tornado in the state was an F3 (severe tornado containing winds of 158 to 206 miles per hour) storm that struck in Love and Carter counties on the afternoon of May 7, causing extensive damage in western sections of the city of Ardmore.

January was generally mild with some locally heavy snowfalls contributing to a slightly greater than normal monthly precipitation. The most notable daily snowfall amounts were 13 inches at Wilburton (Latimer County) on the 13th and 12 inches at Bluejacket (Craig) on the 22nd. Wilburton reported 15.7 inches of snow during the month to establish a new station record for January snowfall. In February, temperatures across the state averaged 4.4 degrees above normal while precipitation was 1.29 inches below normal, ranking the month as the state's 19th warmest and 8th driest February on record.

The state received above normal precipitation each month from March through September. During that period, only August had a greater than normal monthly temperature. Frequent

rains in May delayed the maturing of the wheat crop but heavy rains during the first two weeks of June presented greater problems. Extensive flooding in Tillman County washed out much of the newly planted cotton crop in that area, requiring much of the crop to be replanted. Most of the city of Davidson was flooded on the 5th. Flooding was reported in other areas of the state during the period, including Kingfisher (Kingfisher) and Miami (Ottawa) from the 7th through the 9th. The Salt Fork of the Arkansas and the Chikaskia River inundated most of western and central Kay County, around Tonkawa and Blackwell. Widespread flooding was reported along various creeks in Payne and Noble counties. Deer and Cottonwood creeks flooded in northwestern Oklahoma County, leading to flooding in Guthrie (Logan).

Three short hot spells during July reminded state residents that there was a summer, although compensating cool spells left the monthly temperature slightly below normal. Lake Eufaula reported the high temperature for the year (115 degrees) on the 12th. A severe thunderstorm moved through the Oklahoma City metropolitan area on the night of July 23 producing winds as great as 97 miles per hour at both Will Rogers airport in the city's southwest and Tinker Air Force Base to the southwest. The winds snapped power poles, leaving approximately 175,000 people without power, some of them for several days.

Moisture associated with the remnants of tropical storm Dean moved through western Oklahoma during the first week of August. Locally heavy rains caused extensive flooding in Stillwater (Payne) and near Okesa (Osage) on the 1st. On the 2nd and 3rd, heavy rain fell in a 75-mile-wide band Alfalfa and Grant counties in northern Oklahoma through Harmon County in the southwest. Unofficial measurements indicate that as much as 16 inches of rain fell near Hawley in western Grant County. Observers at Great Salt Plains Dam (Alfalfa) and Cherokee (Alfalfa) reported over 10 inches of rain. Reports of 8 inches or more of precipitation extended southward to Hollis (Harmon). Street flooding was reported in Cherokee, Fairview (Major) and Blackwell (Kay). Floodwater from the Salt Fork of the Arkansas inundated parts of Grant and Kay counties. Interstate 35 west of Tonkawa (Kay) was closed for 15 hours when floodwater covered the highway bridge and its approaches. Flooding along the Canadian, Cimarron and Washita rivers closed several highways in west central Oklahoma. The precipitation from Dean was supplanted by a ridge of high pressure that minimized precipitation for the rest of the month. Precipitation was rare and temperatures in the 100s were commonplace for the remainder of the month.

September was hot and dry across the northern third of Oklahoma, but cool and wet elsewhere. Cool, rainy weather in the southwest was especially evident, to the detriment of the maturing cotton crop. The lack of warm weather, particularly after a late planting, made the 1995 cotton yield the smallest in state history.

October and November were sunny, dry and cool, perfect autumn weather for football fans and outdoor enthusiasts, but alarming to wheat farmers and cattle producers who watched soil moisture supplies deplete rapidly and the winter wheat struggle to establish a stand. Slightly above normal precipitation and near normal temperatures prevailed in December, most of the precipitation falling around the middle of the month.
