MONTHLY SUMMARY FOR MAY 1999

Oklahoma suffered a devastating tornado outbreak on May 3-4. Upwards of 50 tornadoes killed at least 44 people in central Oklahoma in the state's deadliest tornado event since the 1947 Woodward tornado. One tornado on the 3rd produced F5 damage in the Bridge Creek community in northeastern Grady County and across northern Moore (Cleveland County) and F4 damage in southern Oklahoma City, extending into Del City and Midwest City (Oklahoma County). Most of the fatalities occurred in these densely populated areas. A mobile Doppler radar operated by researchers from the University of Oklahoma and the National Severe Storms Laboratory recorded a maximum wind of 318 miles per hour in the funnel, but above the level of surface winds.

Storms that struck Dover (Kingfisher) and Mulhall (Logan) on the 3rd gained F4 status and also produced fatalities. Additional F3 damage was reported near Apache (Caddo), between Chickasha and Verden (Grady), from Sparks to Stroud (Lincoln), and near Omega (Kingfisher) on the 3rd and near Short (Sequoyah) on the morning of the 4th. Tornadoes were reported in 29 counties from late afternoon on the 3rd through mid-day on the 4th. The final accounting is not yet complete, but the month's tornado total probably will surpass the state record for a single month (61 in May 1960).

Overall, May 1999 was a month that was wetter than normal. Precipitation, averaged statewide, totaled 5.51 inches, according to preliminary data from the National Weather Service. The monthly total was 0.65 inch greater than normal and was the 40th greatest May rainfall since 1892. The spring season just completed was the 7th wettest of the 108 years on record, producing a total of 15.48 inches of precipitation (4.72 inches greater than normal). The year-to-date precipitation total of 18.55 inches is 4.80 inches greater than normal, ranking 1999 as the 12th wettest January-through-May on record in Oklahoma.

Frequent rainfall and abundant cloudiness held temperatures down for the most part. The month's average temperature, statewide, was 67.5 degrees, 1.2 degrees less than normal and the 35th lowest May temperature on record in Oklahoma. This completed the 30th coolest spring on record. The March-through-May average temperature of 58.7 degrees was 1.3 degrees lower than normal. The year-to-date remains higher than normal with a statewide average of 53.0 degrees, 1.3 degrees greater than normal, the 29th warmest January-through-May over 108 years of available records.

Tornadoes apart from the May 3-4 episode were reported near Beggs (Muskogee), Soper (Choctaw), and Box (Sequoyah) on the 11th. Oklahoma Mesonet maximum wind reports included 91 miles per hour at Mangum (Greer) and 85 miles per hour at May Ranch (Woods). Several flooding episodes were reported including: on the 4th in Rogers, Tulsa, Latimer and Ottawa counties; on the 11th in Cherokee, Mayes, Muskogee, Choctaw, Wagoner, and Pushmataha counties; on the 17th in Latimer and LeFlore counties; on the 21st in LeFlore County; and on the 22nd and 23rd in Kay, Tulsa, Cherokee, and Okmulgee counties. Softball-sized hail was reported near Altus (Jackson) and Minco (Grady) on the 4th.

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

- Station Name:**
- Station Identification Number:** These are usually assigned by the National Climatic Data Center.
- Climate Division:** See the figure above.
- Number of Temperature Observations:** These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.
- Deviation from Normal:** The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.
- Maximum Daily Maximum:** The maximum daily maximum temperature observed during the current month and year and the day which it occurred.
- Minimum Daily Minimum:** The minimum daily minimum temperature observed during the current month and year and the day which it occurred.
- Heating Degree Days:** HDD are calculated each day of the month for which there is a temperature report and the average temperature for the day is less than 65 degrees. Daily values are summed to arrive at a monthly total. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

$$\sum_{i=1}^{29} 65 - ((TMAX_i + TMIN_i) / 2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and the average temperature for the day exceeds 65 degrees. Daily values are summed to give a monthly total. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i) / 2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

OKLAHOMA CITY CLIMATE CALENDAR
 DATA COURTESY OF NATIONAL WEATHER SERVICE NORMAN

JULY

The data on this calendar is for Oklahoma City.
 Normal values are calculated for the period 1961-1990.
 Temperature extremes are for the period 1891-1997.
 Precipitation extremes are for the period 1891-1997.
